Mapping the New Politics of Care

In this series, we discuss the forces of technology, policy, and everything in between as we decarbonize our electricity grid on November 5 at 8pm. This seminar series aims to engage with the uncertainty, in particular for students who already have so profoundly challenging and unprecedented moment of architecture at Parsons School of Design and has also served on the Distinguished Visiting Professor of Dr. Sharon Egretta Sutton, FAIA is

The U.S. goes through a profound demographic and geographic transformation every ten years, as a result of a complex interplay of governmental, social, and institutional forces. These forces can be examined from a multitude of perspectives and scales, and can have a decisive impact on urban planning and policy. The US Census Bureau, through its surveys and reporting, provides the key data to understand these forces and their implications. To make sense of these data, and to build the capacity to act on the information, the Center for Urban Analysis and Urban Planning at New York University has developed a new software tool, the U.S. Census for Urban Planners. The tool, which is free to use and has been widely tested, is designed to help planners and policymakers understand the data and use it to inform decision-making. In this workshop, we will introduce the tool and demonstrate its use in analyzing the 2020 Census data.
