Generative design

Professor: Danil Nagy
Tuesday 9:00am-11:00am
Avery Ware Lounge

*Look deep into nature, and then you will understand everything better.*
   - Albert Einstein

I. Intelligent machines

In the past decade, our interaction with the world has been deeply affected by artificial intelligence. Many industries including finance, science, and manufacturing have been revolutionized by developments in Machine Learning, optimization, and other artificial intelligence technologies, which have allowed them to leverage the power of computing to solve complex problems in new and innovative ways.

Meanwhile, architectural design practice has been barely impacted by these developments. Although almost all designers use computers in their practice, the tools they rely on have not leveraged these emerging technologies. As a result, the design profession has not substantially evolved since computers were first introduced to the design world nearly four decades ago.

II. Learning from nature

Perhaps the greatest opportunity for artificial intelligence in design practice today is its ability to leverage another, much older form of intelligence - natural intelligence. Designers have always been inspired by the forms of nature, and their abilities to solve difficult problems in novel and beautiful ways. However, up to this point our inspiration from nature has been limited to ‘bio-mimicry’, or the reproduction of nature’s physical forms in new designs. Can we go a step further and actually design like nature?
To do this we have to first understand how nature designs. The basic element of nature’s design is the species, a kind of model which encodes all of the unique properties and abilities of its individual members. The basic tool of nature’s design is evolution, which is an iterative process by which species are able to adapt and improve based on interaction with other species and their environment.

III. Automating design

This class will explore how we can use new technology to leverage nature’s design methods to create new design workflows:

1. Instead of designing objects, we will learn to design systems which encode the full range of possibilities of a particular design concept
2. We will then learn methods for measuring and quantifying the performance of these systems so that each design can be evaluated automatically by the computer
3. Finally, we will create automated evolutionary processes which will allow the computer to search through our design systems to find novel and high-performing designs.
IV. From tools to partners

These new workflows will allow us to explore a much wider space of design than possible through traditional intuitive methods, and lead not only to the discovery of novel and unexpected solutions, but to a deeper understanding of the design problem itself.

To take advantage of these possibilities, we will have to learn how to work with computers in new ways. Instead of thinking of computers as tools that accomplish specific tasks in predictable ways, we will think of computers and algorithms as partners in our design process.

We will discover that orchestrating such a human/machine design collaboration is actually quite difficult. Artificial and human intelligences work in very different ways, and in order to work together we will have to be much more explicit in how we describe our design concepts and intentions to the computer. However, if we succeed, this interaction will not only create new opportunities for design, but will make us more thoughtful, more responsible, and better human designers.

V. Technology

This course will introduce students to the basic concepts of generative design and teach them how to create complex models that can be controlled and evaluated by an automated search algorithm. The Python programming language will be introduced as a way to amplify the generative complexity of parametric models in Grasshopper. We will also cover techniques for evaluating designs including using third-party Grasshopper plugins for structural and environmental analysis.
Later weeks will dive deeper into the generative design workflow, and focus primarily on the automated search engine itself. Students will learn how to use state-of-the-art genetic algorithms to automatically search through their design models for high-performing solutions, and how to evaluate the search process to derive new knowledge about their design.

Prior knowledge of computer programming in Python is encouraged but not required. A working understanding of Rhino and Grasshopper are a prerequisite for taking the course.

VI. Schedule

Jan 21  Introduction to Generative Design

- Course notes:
  - https://medium.com/generative-design/generative-design-introduction-64fb2db38e1
  - https://medium.com/generative-design/learning-from-nature-fe5b7290e3de
  - https://medium.com/generative-design/step-1-generate-6bf73fb3a004
  - https://medium.com/generative-design/designing-measures-2c66a71b2ff3

- Online tutorials:
  - https://linkedin-learning.pxf.io/nKE96 - LinkedIn Learning foundations course - watch this first
  - https://learning.colidescope.com/courses/generative-design/lesson/welcome-to-generative-design/
  - https://learning.colidescope.com/courses/generative-design/lesson/demo-generative-design-overview/

- Readings:

Jan 28  Introduction to computational design

- Course notes:
  - https://medium.com/generative-design/introduction-to-computational-design-6c0fdfb3f1
  - https://medium.com/generative-design/computational-design-in-grasshopper-1a0b62963690

- Online tutorials:
Feb 4  Introduction to Optimization

- **Course notes:**
  - [https://medium.com/generative-design/design-optimization-2ec2ba3b40f7](https://medium.com/generative-design/design-optimization-2ec2ba3b40f7)
  - [https://medium.com/generative-design/evolving-design-b0941a17b759](https://medium.com/generative-design/evolving-design-b0941a17b759)

- **Online tutorials:**
  - [https://learning.colidescope.com/courses/generative-design/lesson/introduction-to-optimization/](https://learning.colidescope.com/courses/generative-design/lesson/introduction-to-optimization/)

Feb 11  Unpacking the Genetic Algorithm

- **Initial project ideas DUE**
- **Online tutorials:**

- **Readings:**

Feb 18  Scripting in Python

- **Course notes:**
  - [https://medium.com/generative-design/using-python-in-grasshopper-77bfca86e84b](https://medium.com/generative-design/using-python-in-grasshopper-77bfca86e84b)
  - [https://medium.com/generative-design/fundamentals-of-python-variables-b0523dd698a7](https://medium.com/generative-design/fundamentals-of-python-variables-b0523dd698a7)
  - [https://medium.com/generative-design/working-with-geometry-in-python-a256de7bb1b1](https://medium.com/generative-design/working-with-geometry-in-python-a256de7bb1b1)

- **Online tutorials:**
February 25

Visualizing Generative Design

- Online tutorials:

- Readings:

March 3

Simulation I - Structures and view

- Course notes:
  - [https://medium.com/generative-design/structural-analysis-with-karamba-a73b959587c0](https://medium.com/generative-design/structural-analysis-with-karamba-a73b959587c0)

- Online tutorials:

March 10

Simulation II - Daylight and occupancy

- Course notes:
  - [https://medium.com/generative-design/solar-analysis-in-grasshopper-5dae76c9b6cb](https://medium.com/generative-design/solar-analysis-in-grasshopper-5dae76c9b6cb)
  - [https://medium.com/generative-design/routing-with-graphs-5fb564b02a74](https://medium.com/generative-design/routing-with-graphs-5fb564b02a74)

- Online tutorials:
● Readings:
  ○ Danil Nagy, Lorenzo Villaggi, Dale Zhao, David Benjamin. - Beyond Heuristics, ACADIA (2017) [pdf]

March 17  SPRING BREAK - NO CLASS

March 24  Advanced computational design I - Packing and local optimization

● Midterm assignments DUE (design space model report)
● Course notes:
  ○ https://medium.com/generative-design/control-strategies-b4cf07b26cda
● Online tutorials:
  ○ https://learning.colidescope.com/courses/generative-design/lesson/demo-packing-application-for-site-planning/

March 31  Advanced computational design II - Assignment

● Course notes:
  ○ https://medium.com/generative-design/behavioral-systems-d010d0d11932
● Online tutorials:
  ○ https://learning.colidescope.com/courses/generative-design/lesson/direct-assignment-vs-attractor-points/
  ○ https://learning.colidescope.com/courses/generative-design/lesson/demo-direct-assignment/
  ○ https://learning.colidescope.com/courses/generative-design/lesson/demo-attractor-points

April 7  Advanced computational design III - Recursion and Subdivision

● Course notes:
  ○ https://medium.com/generative-design/recursive-systems-5b1f813b2b8b
● Online tutorials:
  ○ https://learning.colidescope.com/courses/generative-design/lesson/introduction-to-recursion/
April 14  Project feedback  
April 21  Project feedback  

Friday, May 8  Final assignments DUE (report and animation)

- https://learning.colidescope.com/ - online learning portal for video tutorials

VIII.  Additional Readings

Articles, papers, and book chapters:
1. Alan Turing - Computing Machinery and Intelligence (1950) [pdf]  
2. Christopher Alexander - Notes on the Synthesis of Form, Introduction (1964) [pdf]  
5. Kevin Kelly - Out of Control, Chapter 15: Artificial Evolution (1994) [pdf]  
10. Ian Keough and David Benjamin - Multi-objective Optimization in Architectural Design, SimAUD (2010) [pdf]  
12. David Benjamin, Danil Nagy and Carlos Olguin - Growing Details, AD (2014) [pdf]  

Books
IX. Semester project

The main deliverable for the class is a design project which students will develop either individually or in groups of two during the semester.

- **Brief**

  Choose a design problem which you want to solve using the tools of generative design. The scale of the problem is up to you, and can relate to any field of design including but not limited to industrial, architecture, or urban design. For example, you might want to optimize the design of a chair, a room, a building, or an entire city block. You can use your studio project or another current or past project as a starting point, but I would recommend that you recalibrate the scope of your design problem specifically for this class. This will allow you to fully explore the generative design methods without being burdened by too many unnecessary factors.

- **Components**

  1. **Design space model** - create a model that parametrizes the design problem and defines all possible solutions that can be searched by the genetic algorithm. You should be clear in your choice of parameters, and develop a good intuition for how your model navigates the tradeoffs of bias/variance and complexity/continuity.

  2. **Design metrics** - define the objectives and constraints of your model. You should be clear about how these measures relate to the requirements of the design problem, how you value your design, and how you communicate these values to the search algorithm. You can use whatever metrics relate to your design problem, but must include at least one of the simulation methods studied in class (FE structural analysis, ray-based solar analysis, isovist-based view analysis, graph-based flow analysis).

  3. **Design evolution** - using the tools covered in class, run your model through a series of optimization ‘experiments’ to derive novel and high-performing solutions to your design problem. You should be clear about how you are specifying the algorithm's parameters before each experiment, how you are analyzing and learning from the results, and how you are adjusting the process each time based on what you have learned.

**Deliverables**

**Design Space Model report** - Due Tuesday, March 24

- Document your design space and system of measures as a unique design strategy for solving your chosen design problem. Your document should include a description of the following aspects of your design:

  1. What are the dimensions (parameters) of your design space and how does each parameter affect the design?
2. What variable types and control strategies are you using for your parameters, and how does this relate to the complexity and continuity of your design space?
3. What are the boundaries of your design space and how does this relate to the bias vs. variance tradeoff of your design space model?
4. What evaluation metrics are you using and how do they relate to your design goals?
5. What are the “intuitive” solutions in your design space?
6. Do you think your design space is searchable?

- A template** of typical design space visualization strategies will be provided as a starting point for your report following this general outline:
  1. Overview of design problem
  2. Description and diagrams of system for generating design solutions including parameterization
  3. Parameter study diagram showing the geometric expression of individual inputs
  4. Description and diagrams of each metric used to evaluate potential design solutions and how it is computed
  5. Examples of good and bad designs for each metric
  6. Description of potential conflicts or tradeoffs between metrics
  7. Design space model overview diagram
  8. Response surface analysis showing relationship of inputs to outputs, internal structure, and boundaries of the design space (OPTIONAL)
  9. Collection of ‘intuitive’ designs sampled manually from the design space

- In addition to the report, produce at least one GIF animation showing variety of design options (following in-class tutorial)

**Final report and animation - Due Friday, May 8

- For the final deliverable you will update your midterm report with any changes or developments to the design space model, and add to it documentation of the optimization process. This documentation should include the following visualizations and analysis:
  1. Updated design space model overview diagram showing the exact parameter types (continuous, categorical, series, or sequence) and output types (objective min/max or constraint to be met)
  2. Scatter plots (from Explore interactive visualization):
     - *time vs. objective* - is the algorithm learning to pick designs with higher performance over time? (ID or generation along X-axis, objective value along Y-axis, color, and/or size)
     - *time vs. input* - is the algorithm narrowing in on particular strategies over time? (ID or generation along X-axis, input value along Y-axis, color, and/or size)
     - *objective vs. objective* - is there a tradeoff in your objectives that is creating a Pareto front of optimal designs. Is the algorithm able to target the front more and more over time? (objective(s) along X and Y-axes, ID or generation along color)
     - *input vs. objective* - are there particular input values that tend to create higher performing designs? (input(s) along X and Y-axes, objective(s) along color and size)
  3. Overlay images ([https://github.com/danilnagy/process_images](https://github.com/danilnagy/process_images)) showing process of optimization and convergence on design solution over time
4. Final outcomes (selection of high-performing designs or description of a novel set of strategies discovered through the process)
   - A final animation showing the process of optimization over time. The animations can visualize each design in the order it was generated, or you can create composites that collapse all the designs in a single generation into a single image. Then you can either cycle through generations in an animation, or create a grid of images that show the whole optimization all at once. All videos should meet the following criteria:
     1. between 0:30 and 1:00 long
     2. HD widescreen resolution at least 1280x720
     3. .mp4 video format

** You should use these templates as starting points and produce the included diagrams for your project as a minimum requirement. However, since the Generative Design process is still a relatively new methodology, there are few rules of thumb for the types of graphics or diagrams you should produce. Thus you are also encouraged to invent and develop your own graphic strategies that can best visually communicate your particular project and the generative design workflow. You should use this project as an opportunity to not only hone your own graphic style as a designer, but experiment and speculate on new representational methods that relate specifically to the generative design methodology. For reference, a collection of sample graphics can be found here:
