SUPRASTRUCTURE

Core I Studio Framework / Agency-Space Instructor: Jaffer Kolb 2019

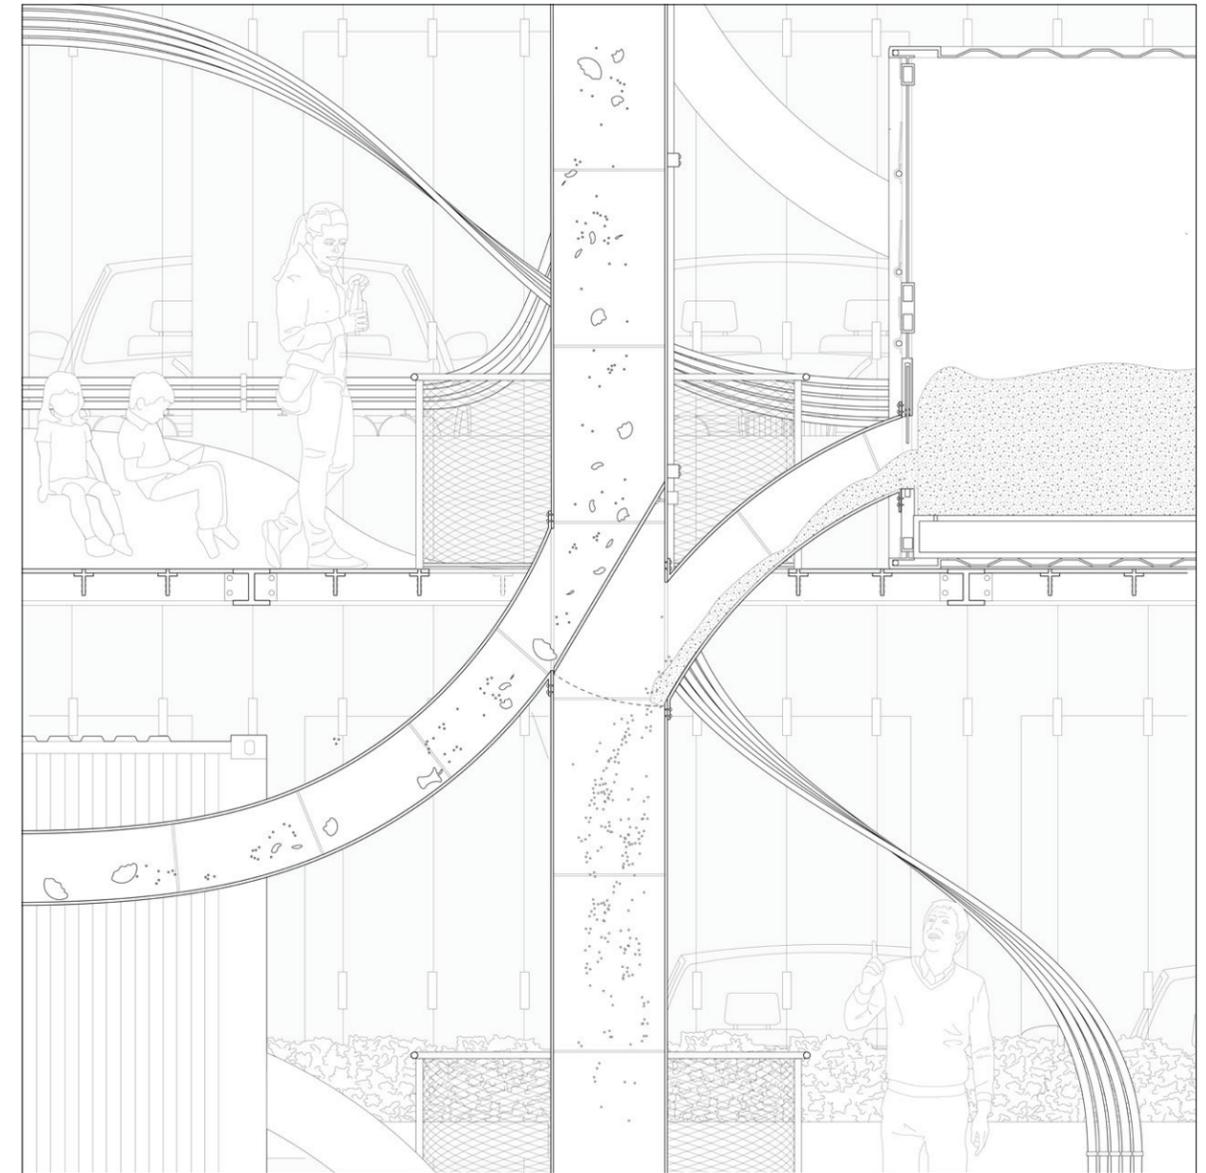

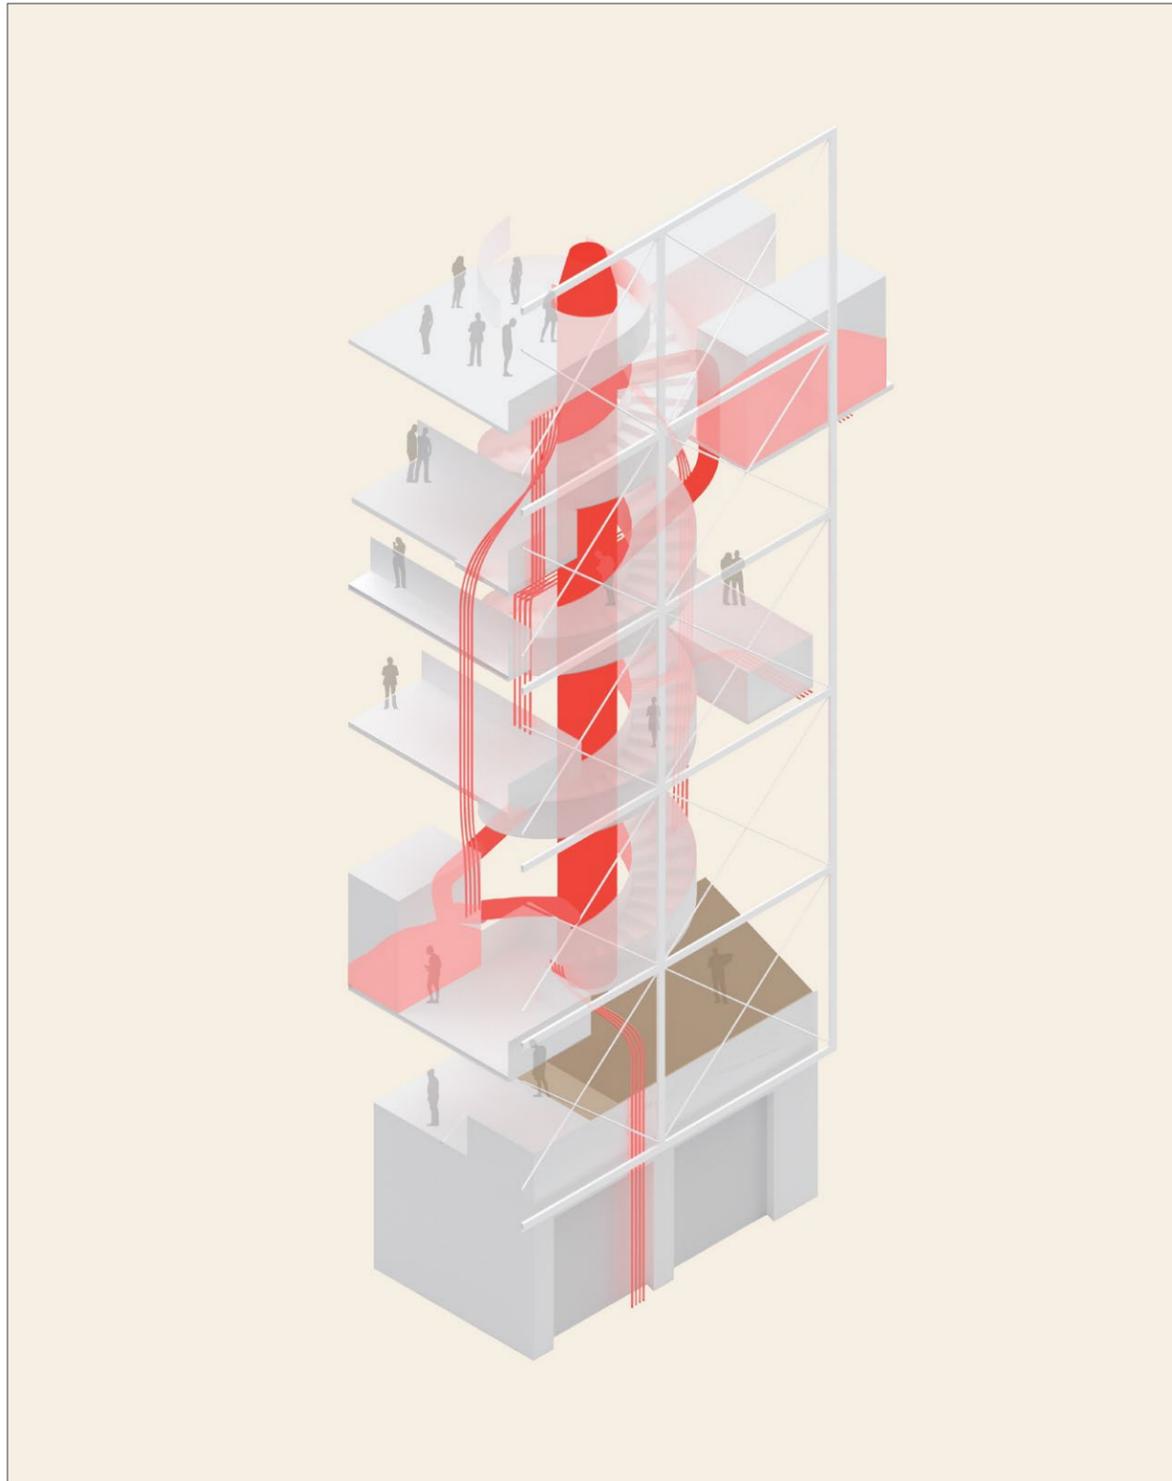

By examining potential overlaps between different city departments in New York, new spaces emerge.

Many NYC Department of Transportation parking garages have articulated facades. But their needlessness for thermal comfort systems allows for a Department of Sanitation community composting system

The intervention occupies a thin (12') strip facing Broadway where neighbors can deposit compost at the top and collect soil at the bottom

SUPRASTRUCTURE

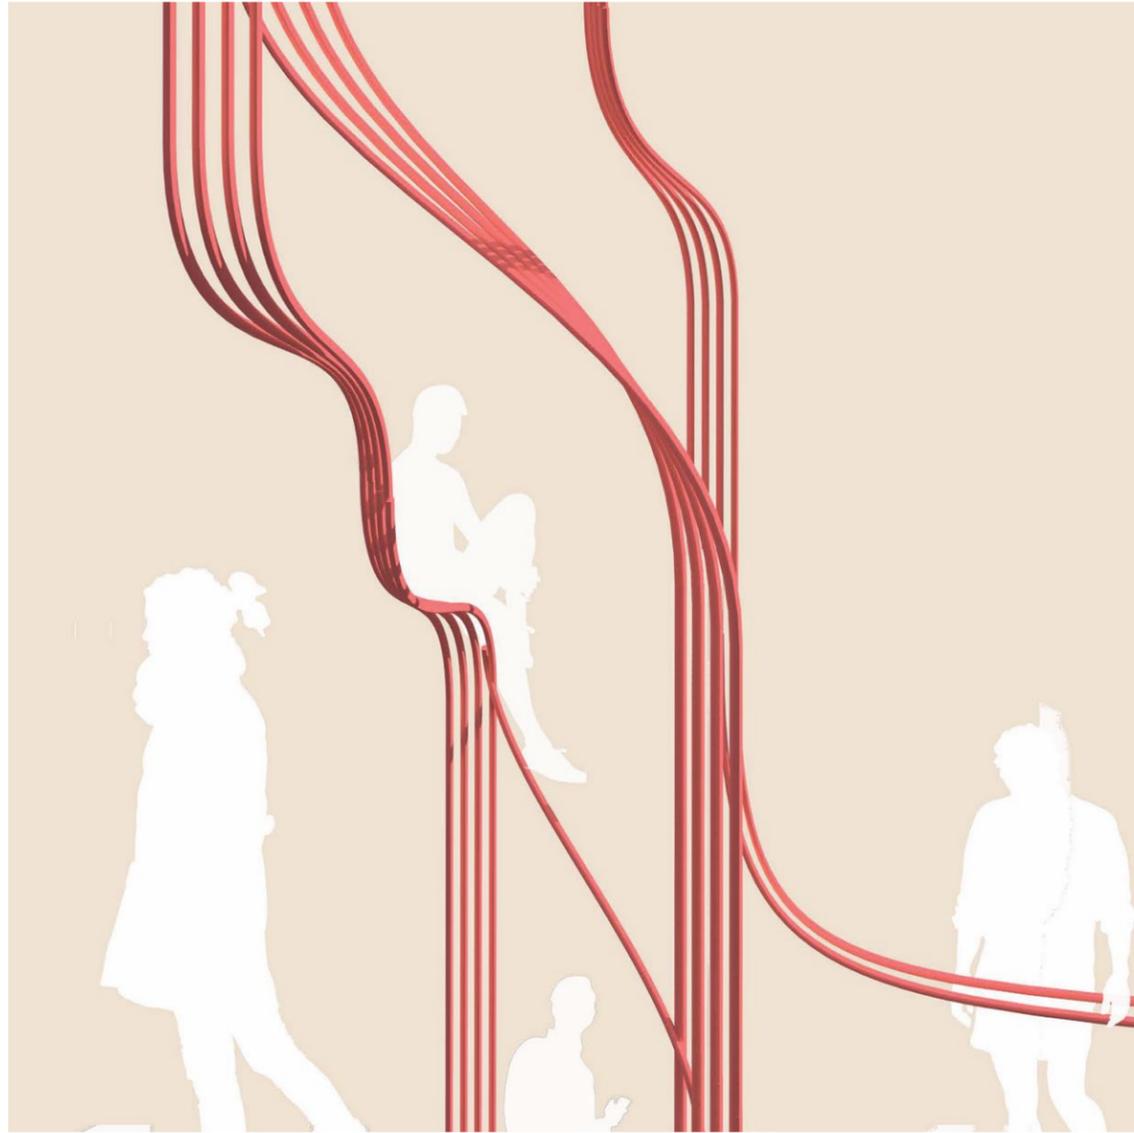

SUPRASTRUCTURE

Public spaces are scattered throughout the structure along side aerobic containers which breakdown waste

Muriel Eukeles's work framed the actions of sanitation as artistic performance. The language of the infrastructure operates the same way. Rather than being hidden, it is used to define space and takes on an ornamental quality.

Core II Adaptation Instructor: Daisy Ames 2020

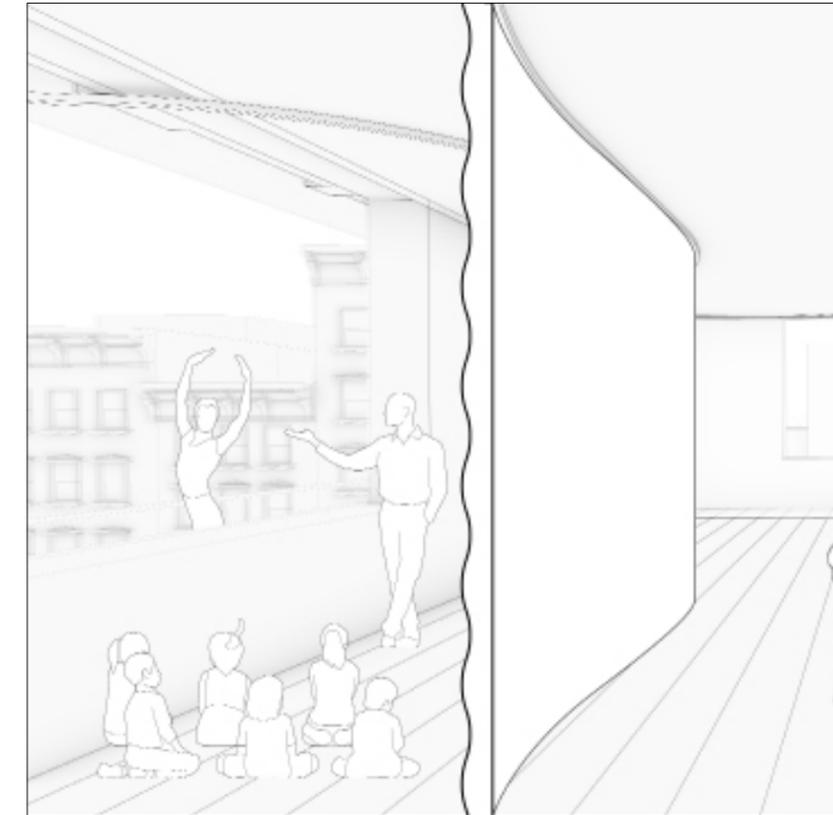

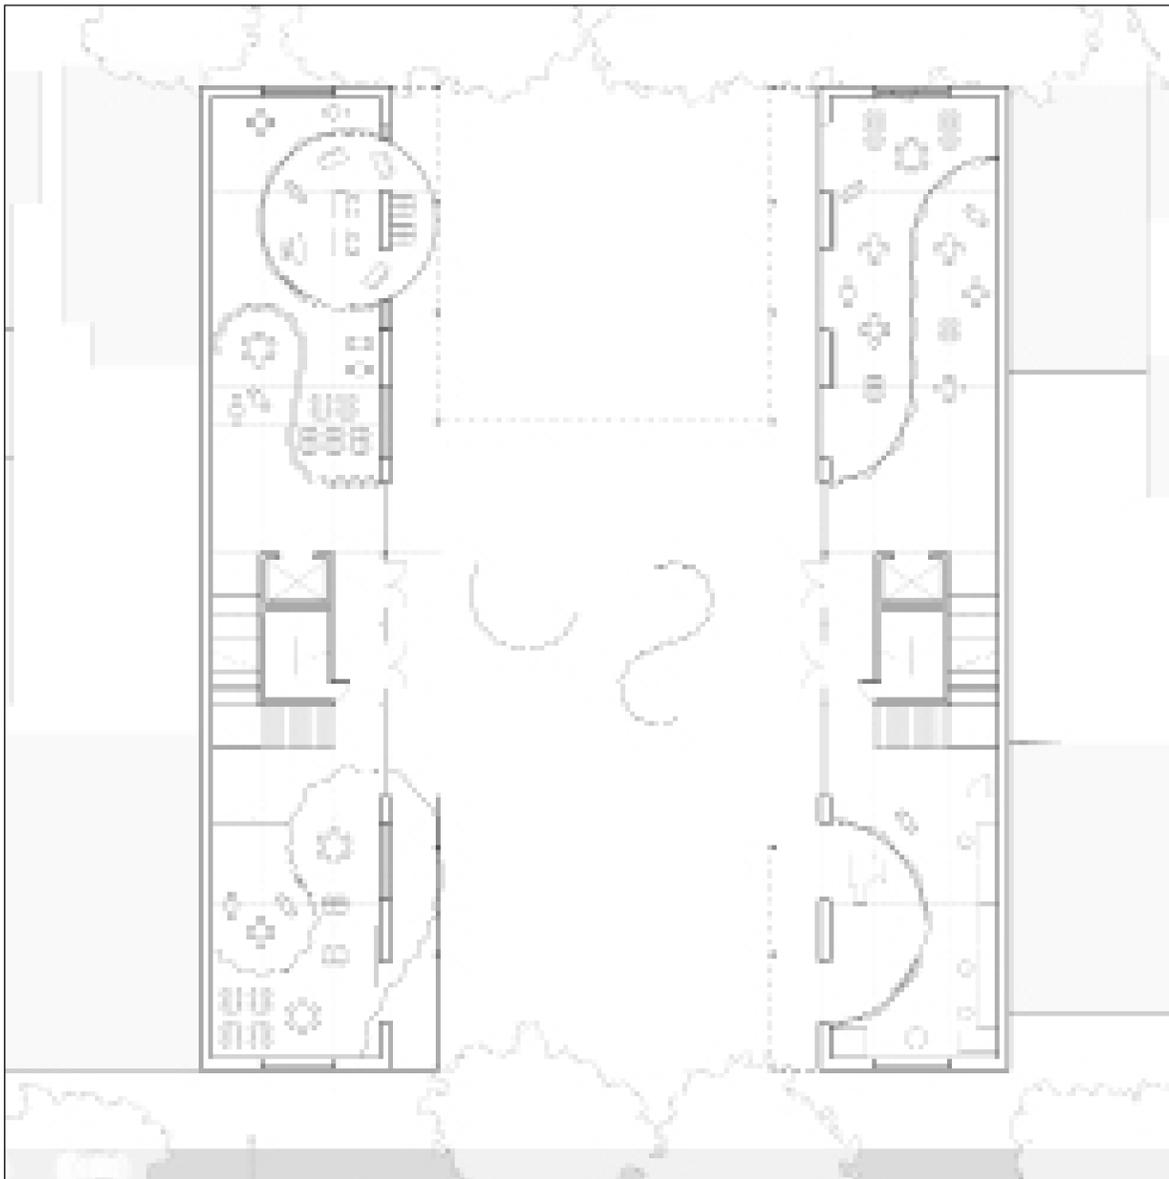

Continually evolving pedagogies often come into conflict with the architecture of schools. The kind of learning and teaching taking place in this school is oriented around performing arts.

The school is oriented around performing arts. A ceiling scape of curtains is deployed to allow for flexibility in program

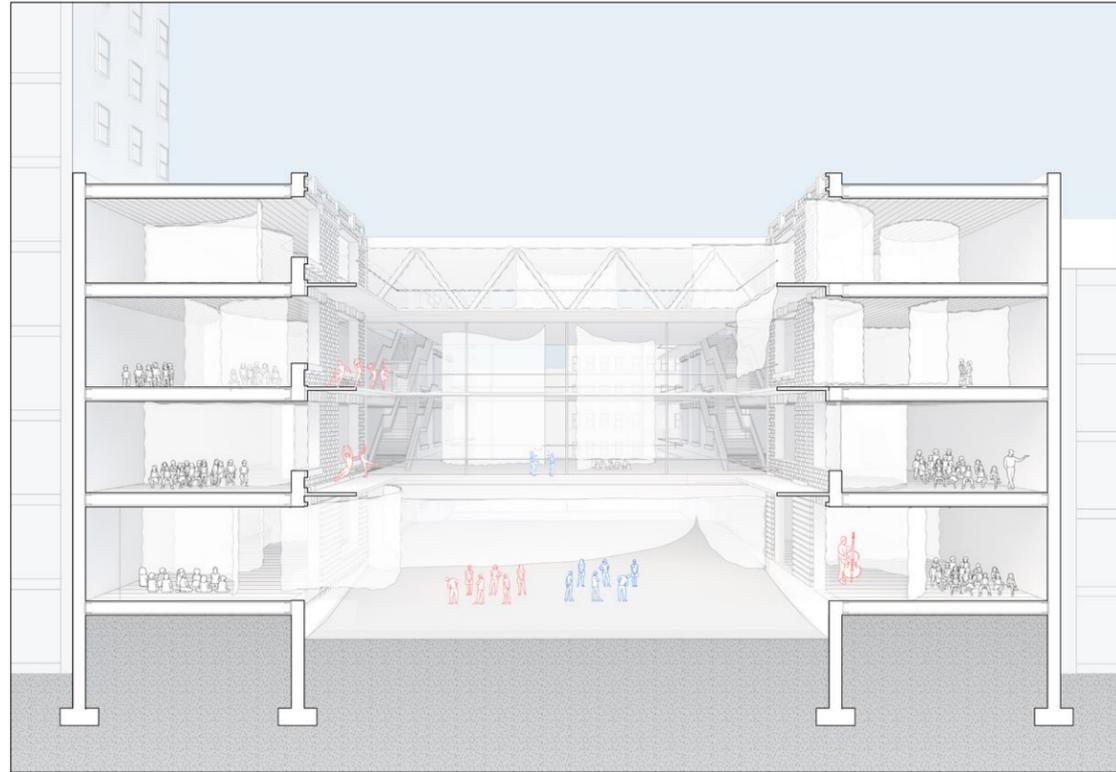

The school takes on the definition of “building” in the way that rooms can change opacity, sizes, and characteristics

Old School

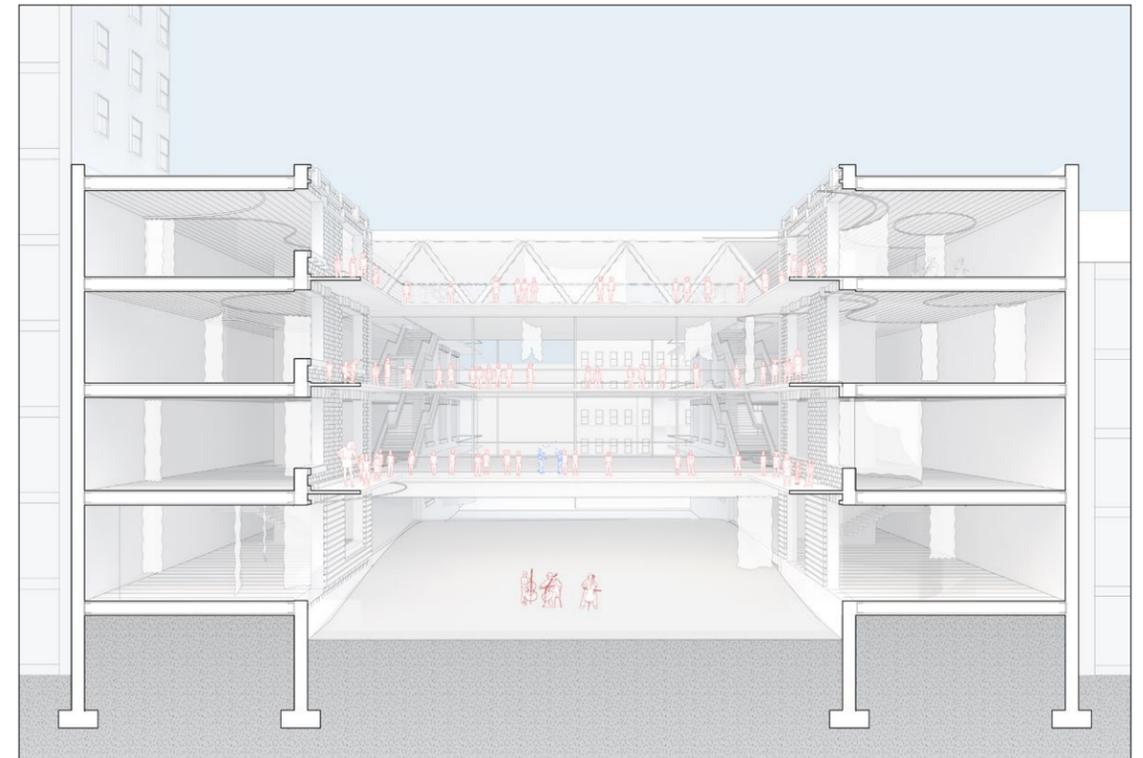

Old School

Old School

All made possible through the design of various curtains with a range of acoustic, transparent, translucent qualities.

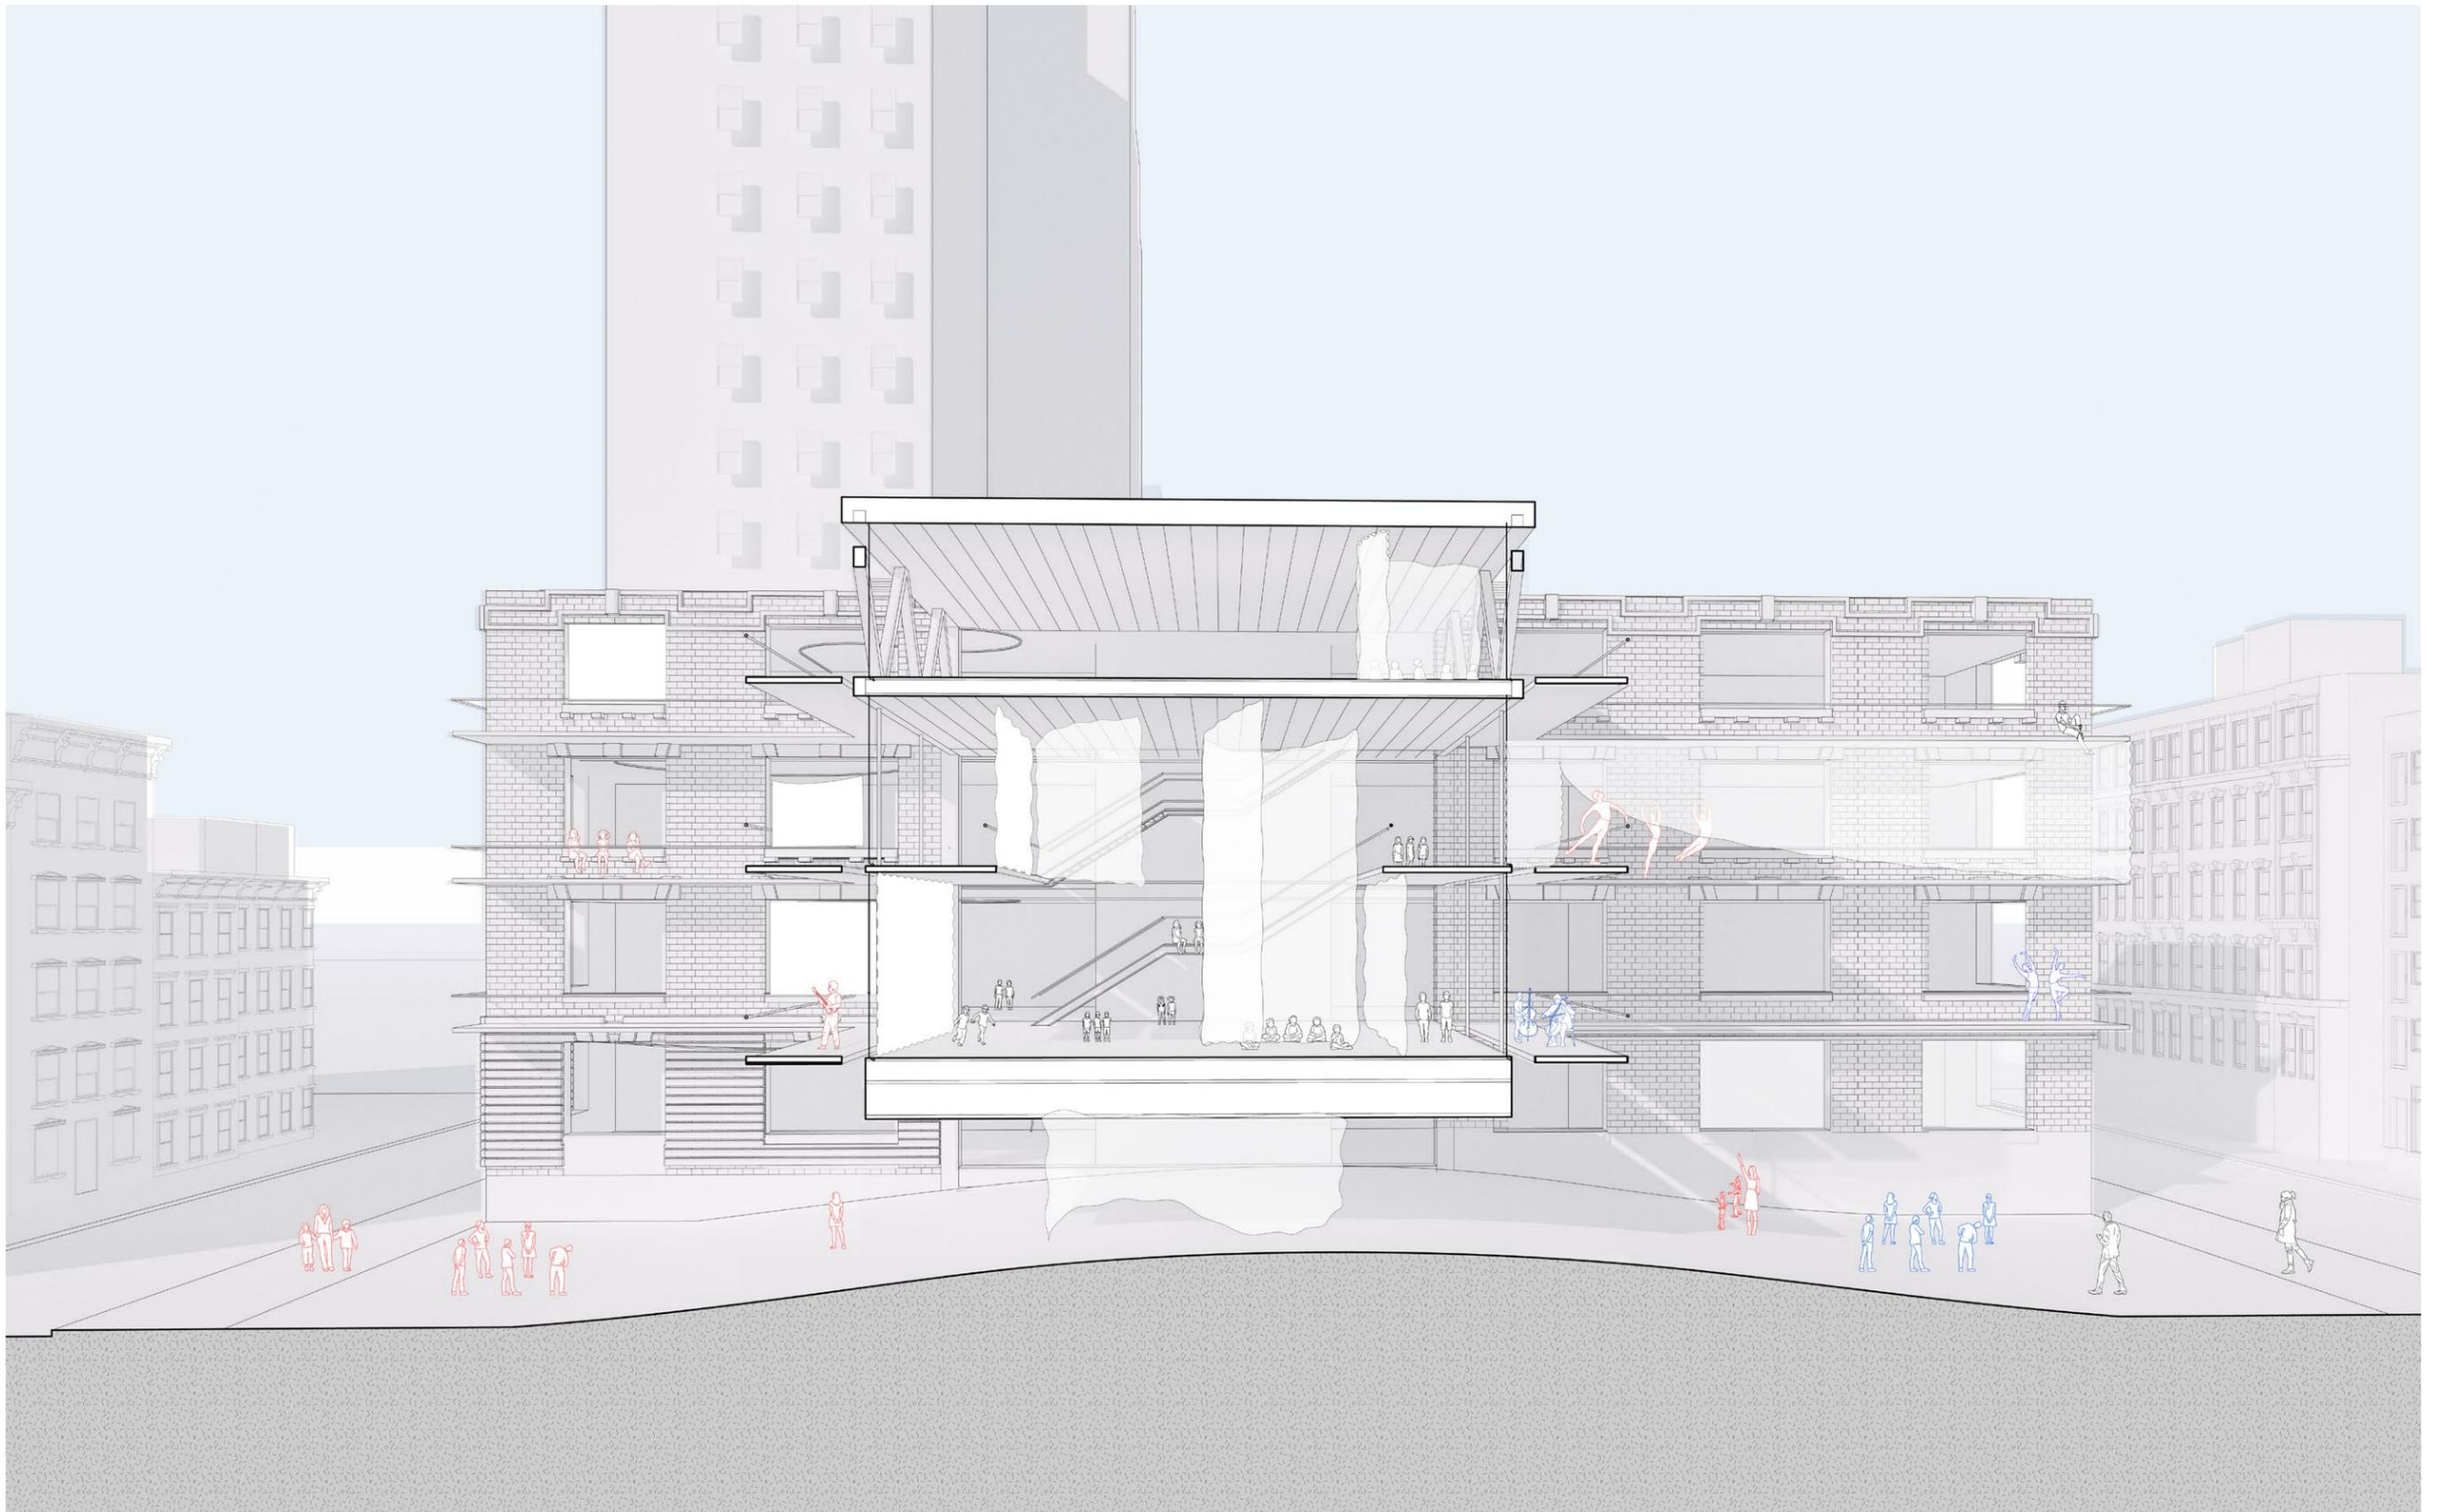

These curtains can create and dismantle new interactions throughout the interior spaces of the building,

A hallway of one's own

Core III Complete & Incomplete Critic: Adam Frampton Partner: Yumeng Liu 2020

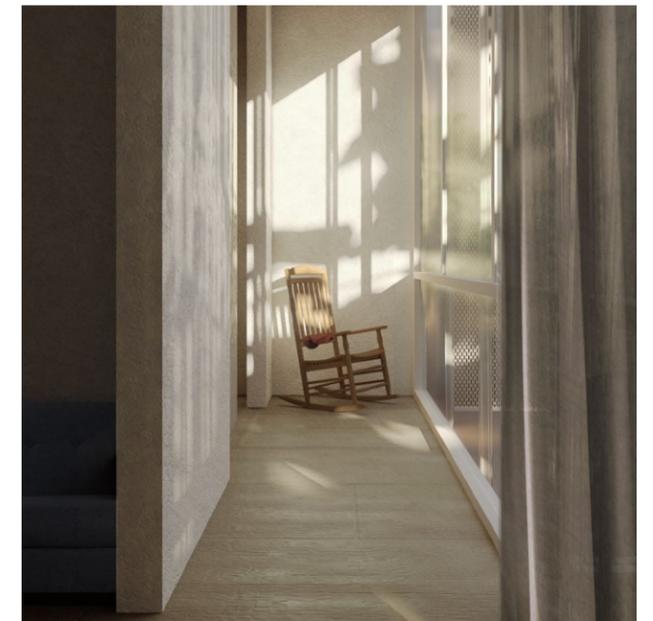

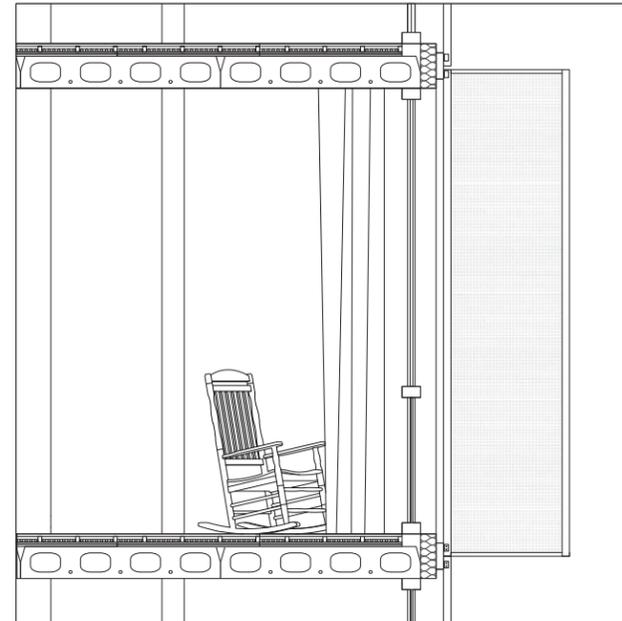

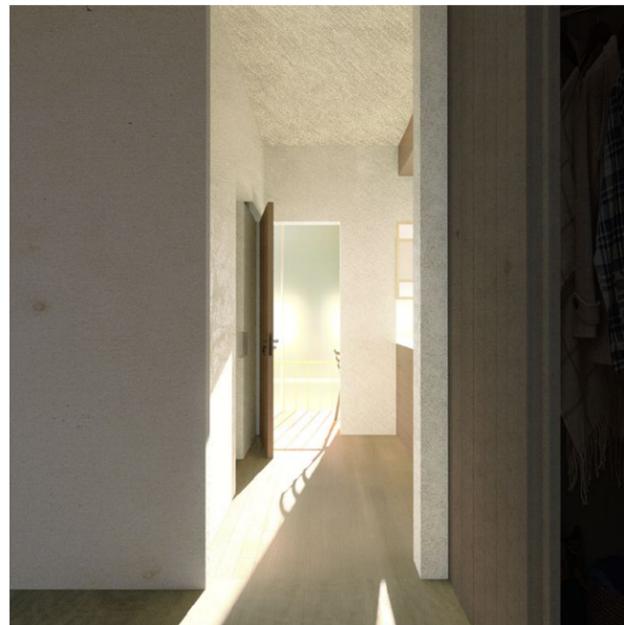

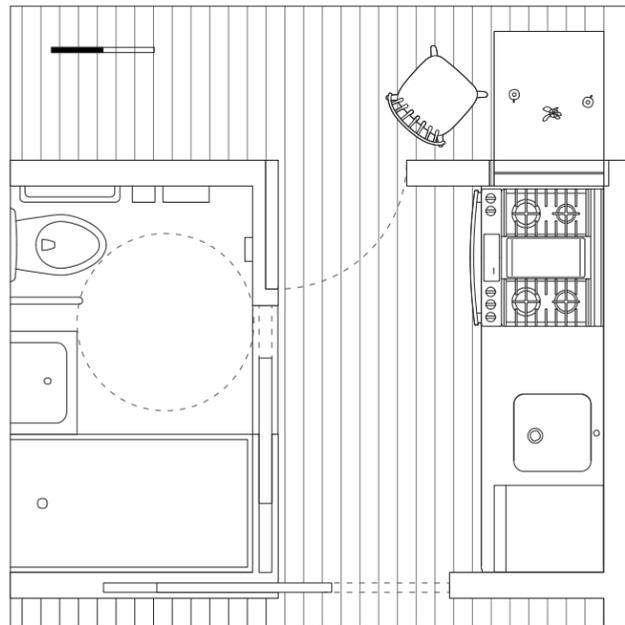

This project explores the potential of the hallway, often a space determined by efficiency, to house communal activity.

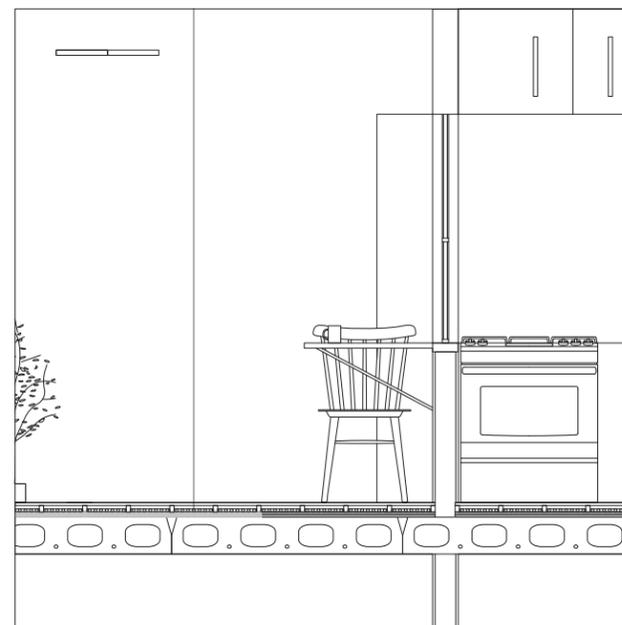

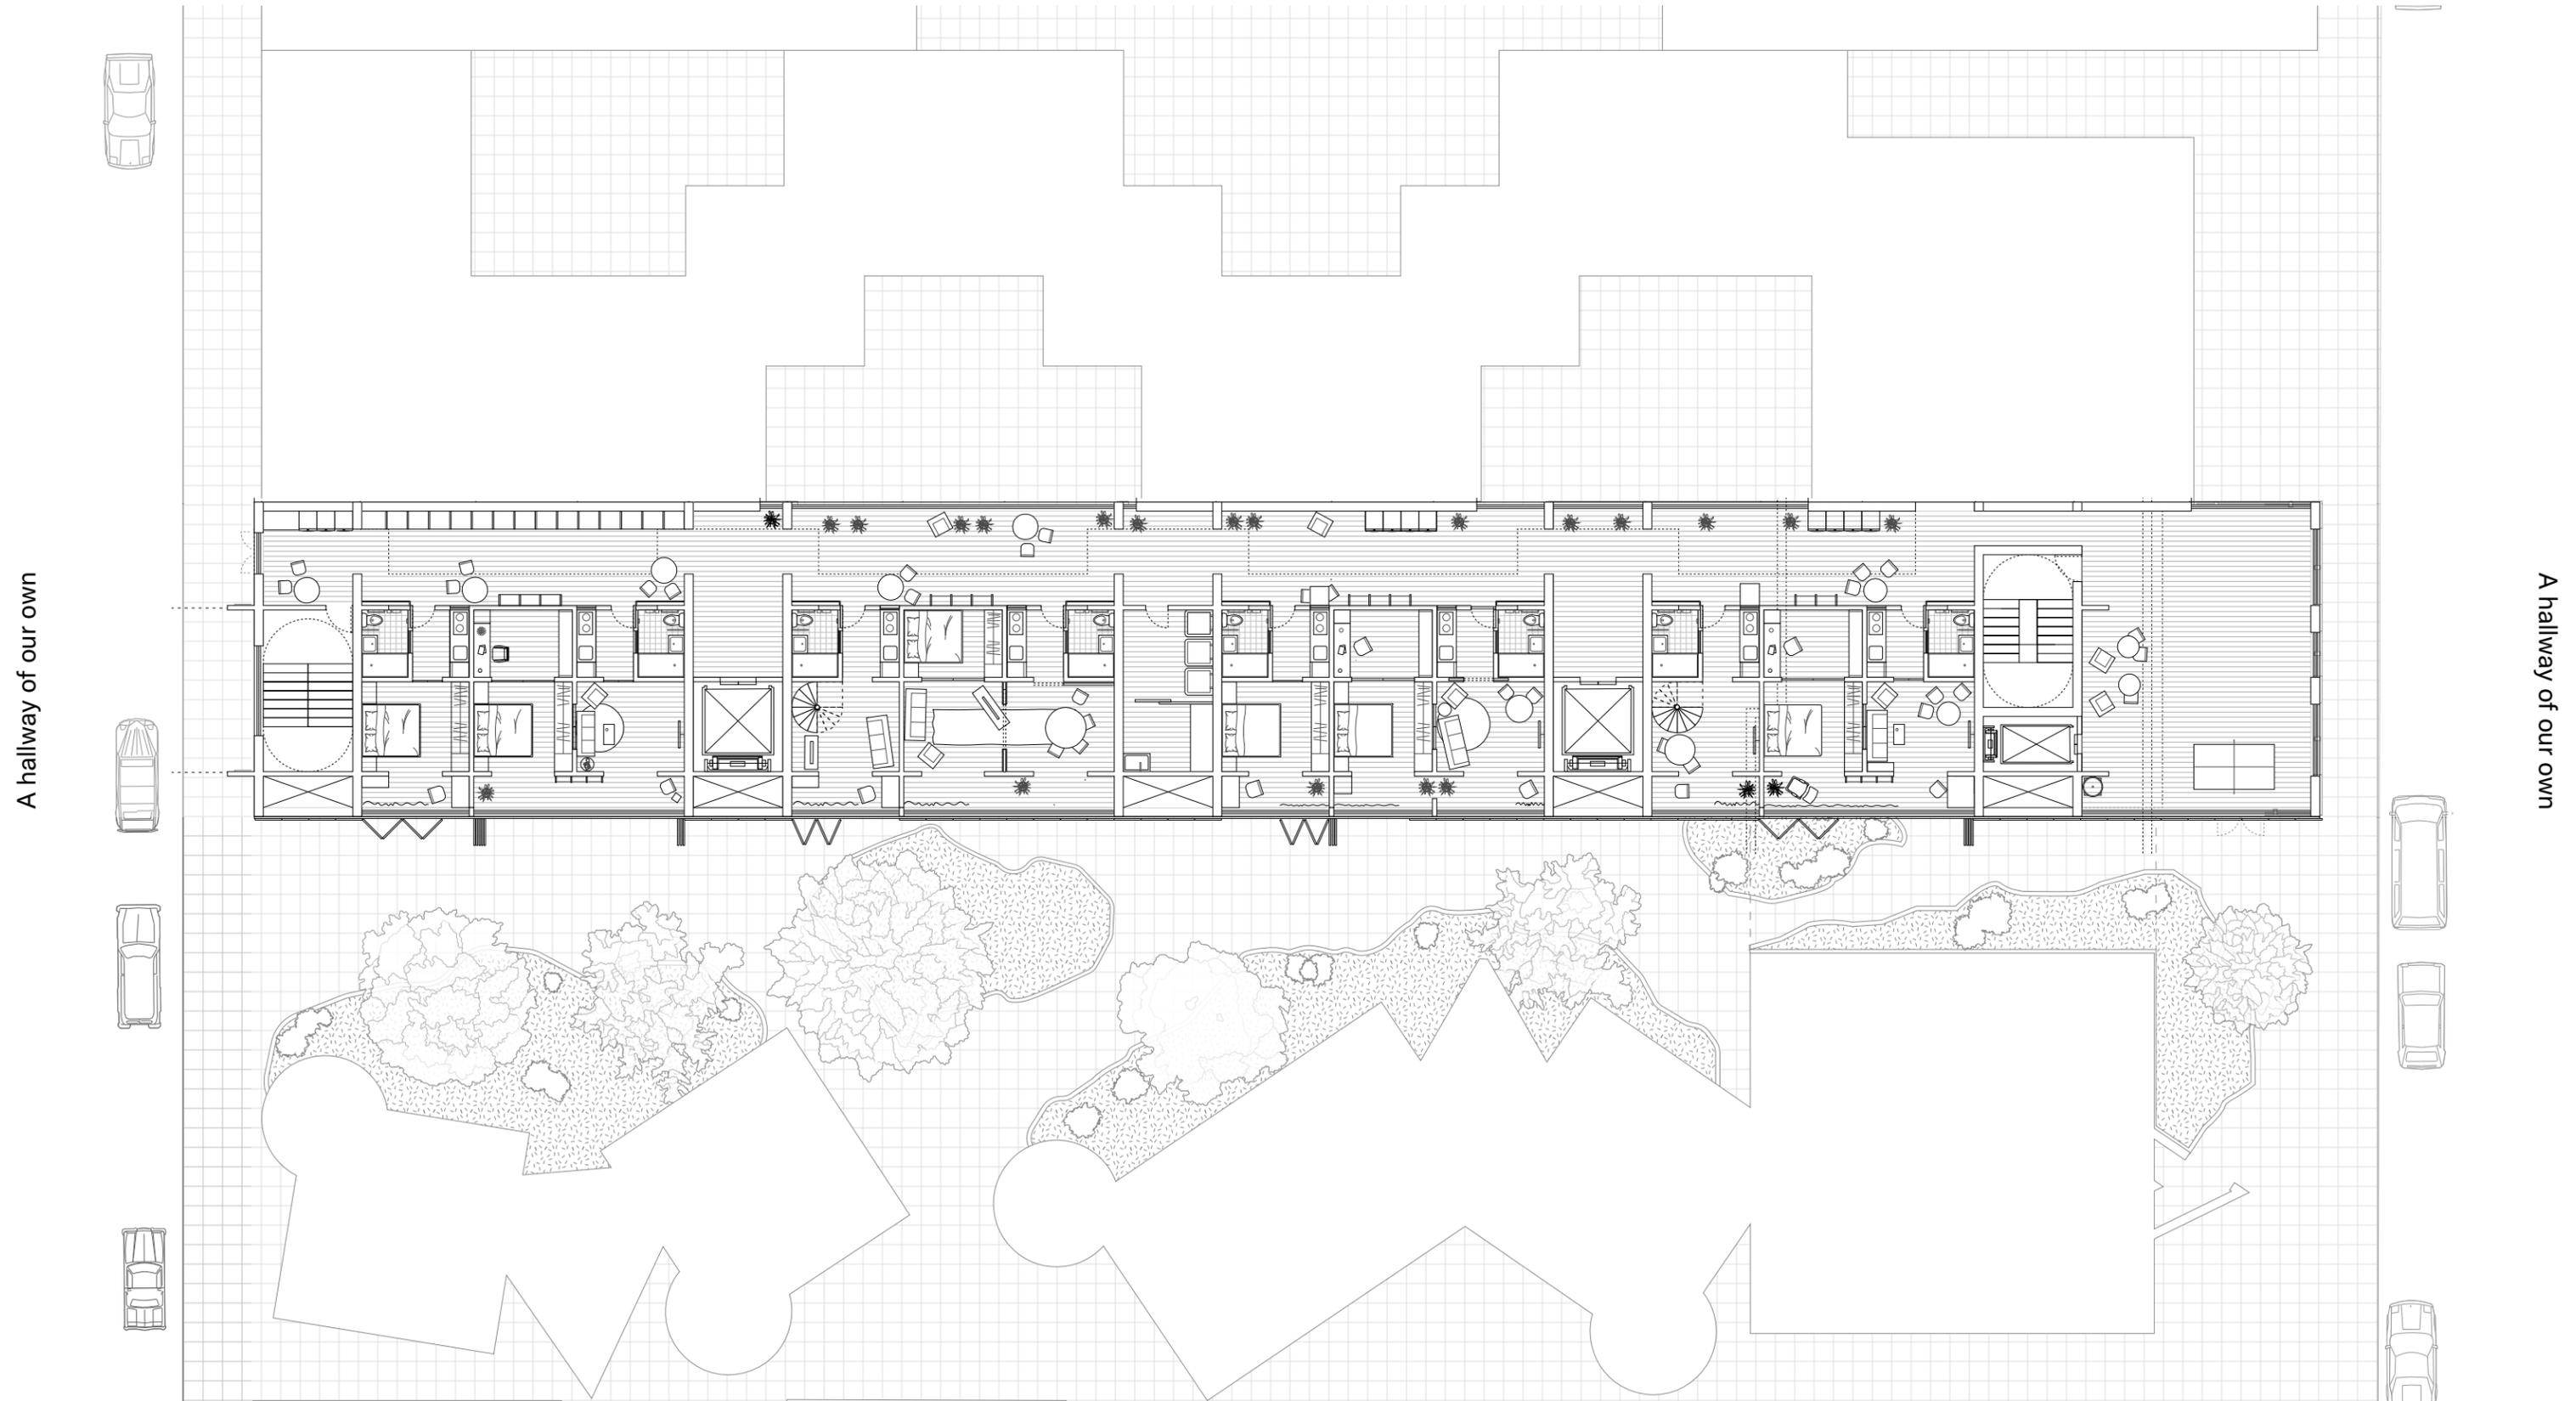

The project also redefines the boundaries between the domestic and the communal through a series of thresholds that allow occupants to determine their relationship with the communal hallway.

A hallway of our own

A hallway of our own

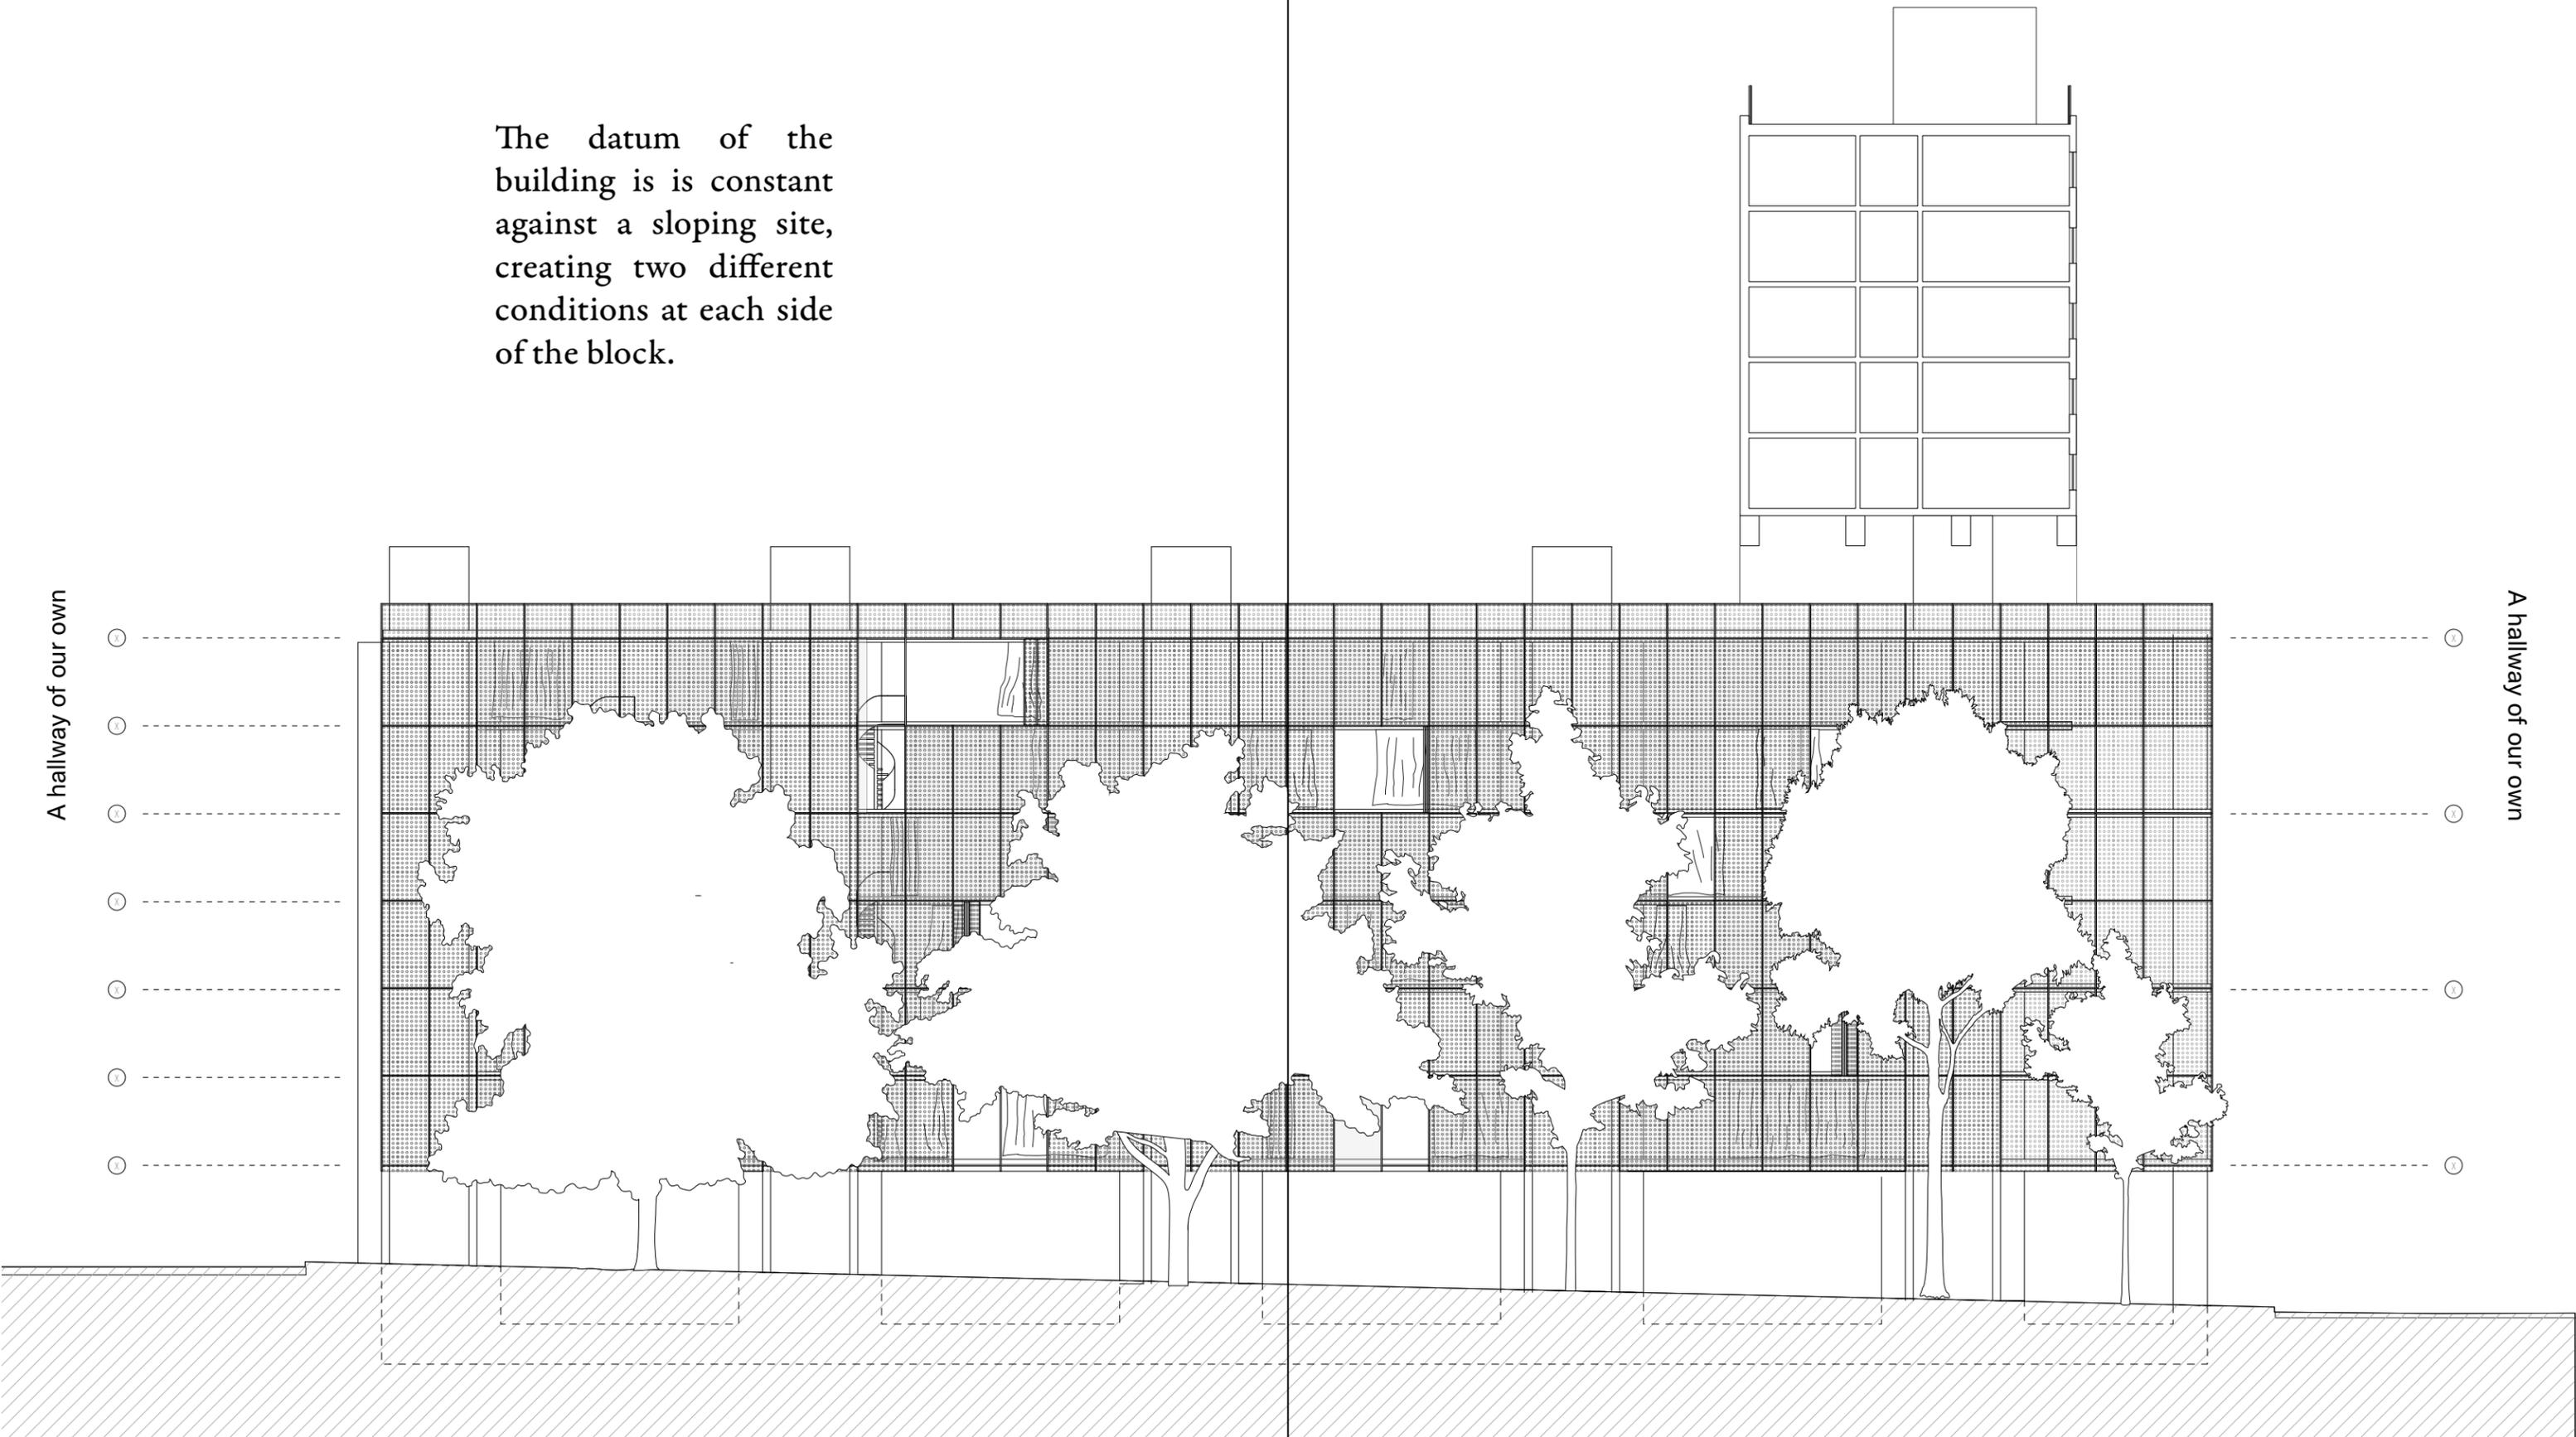

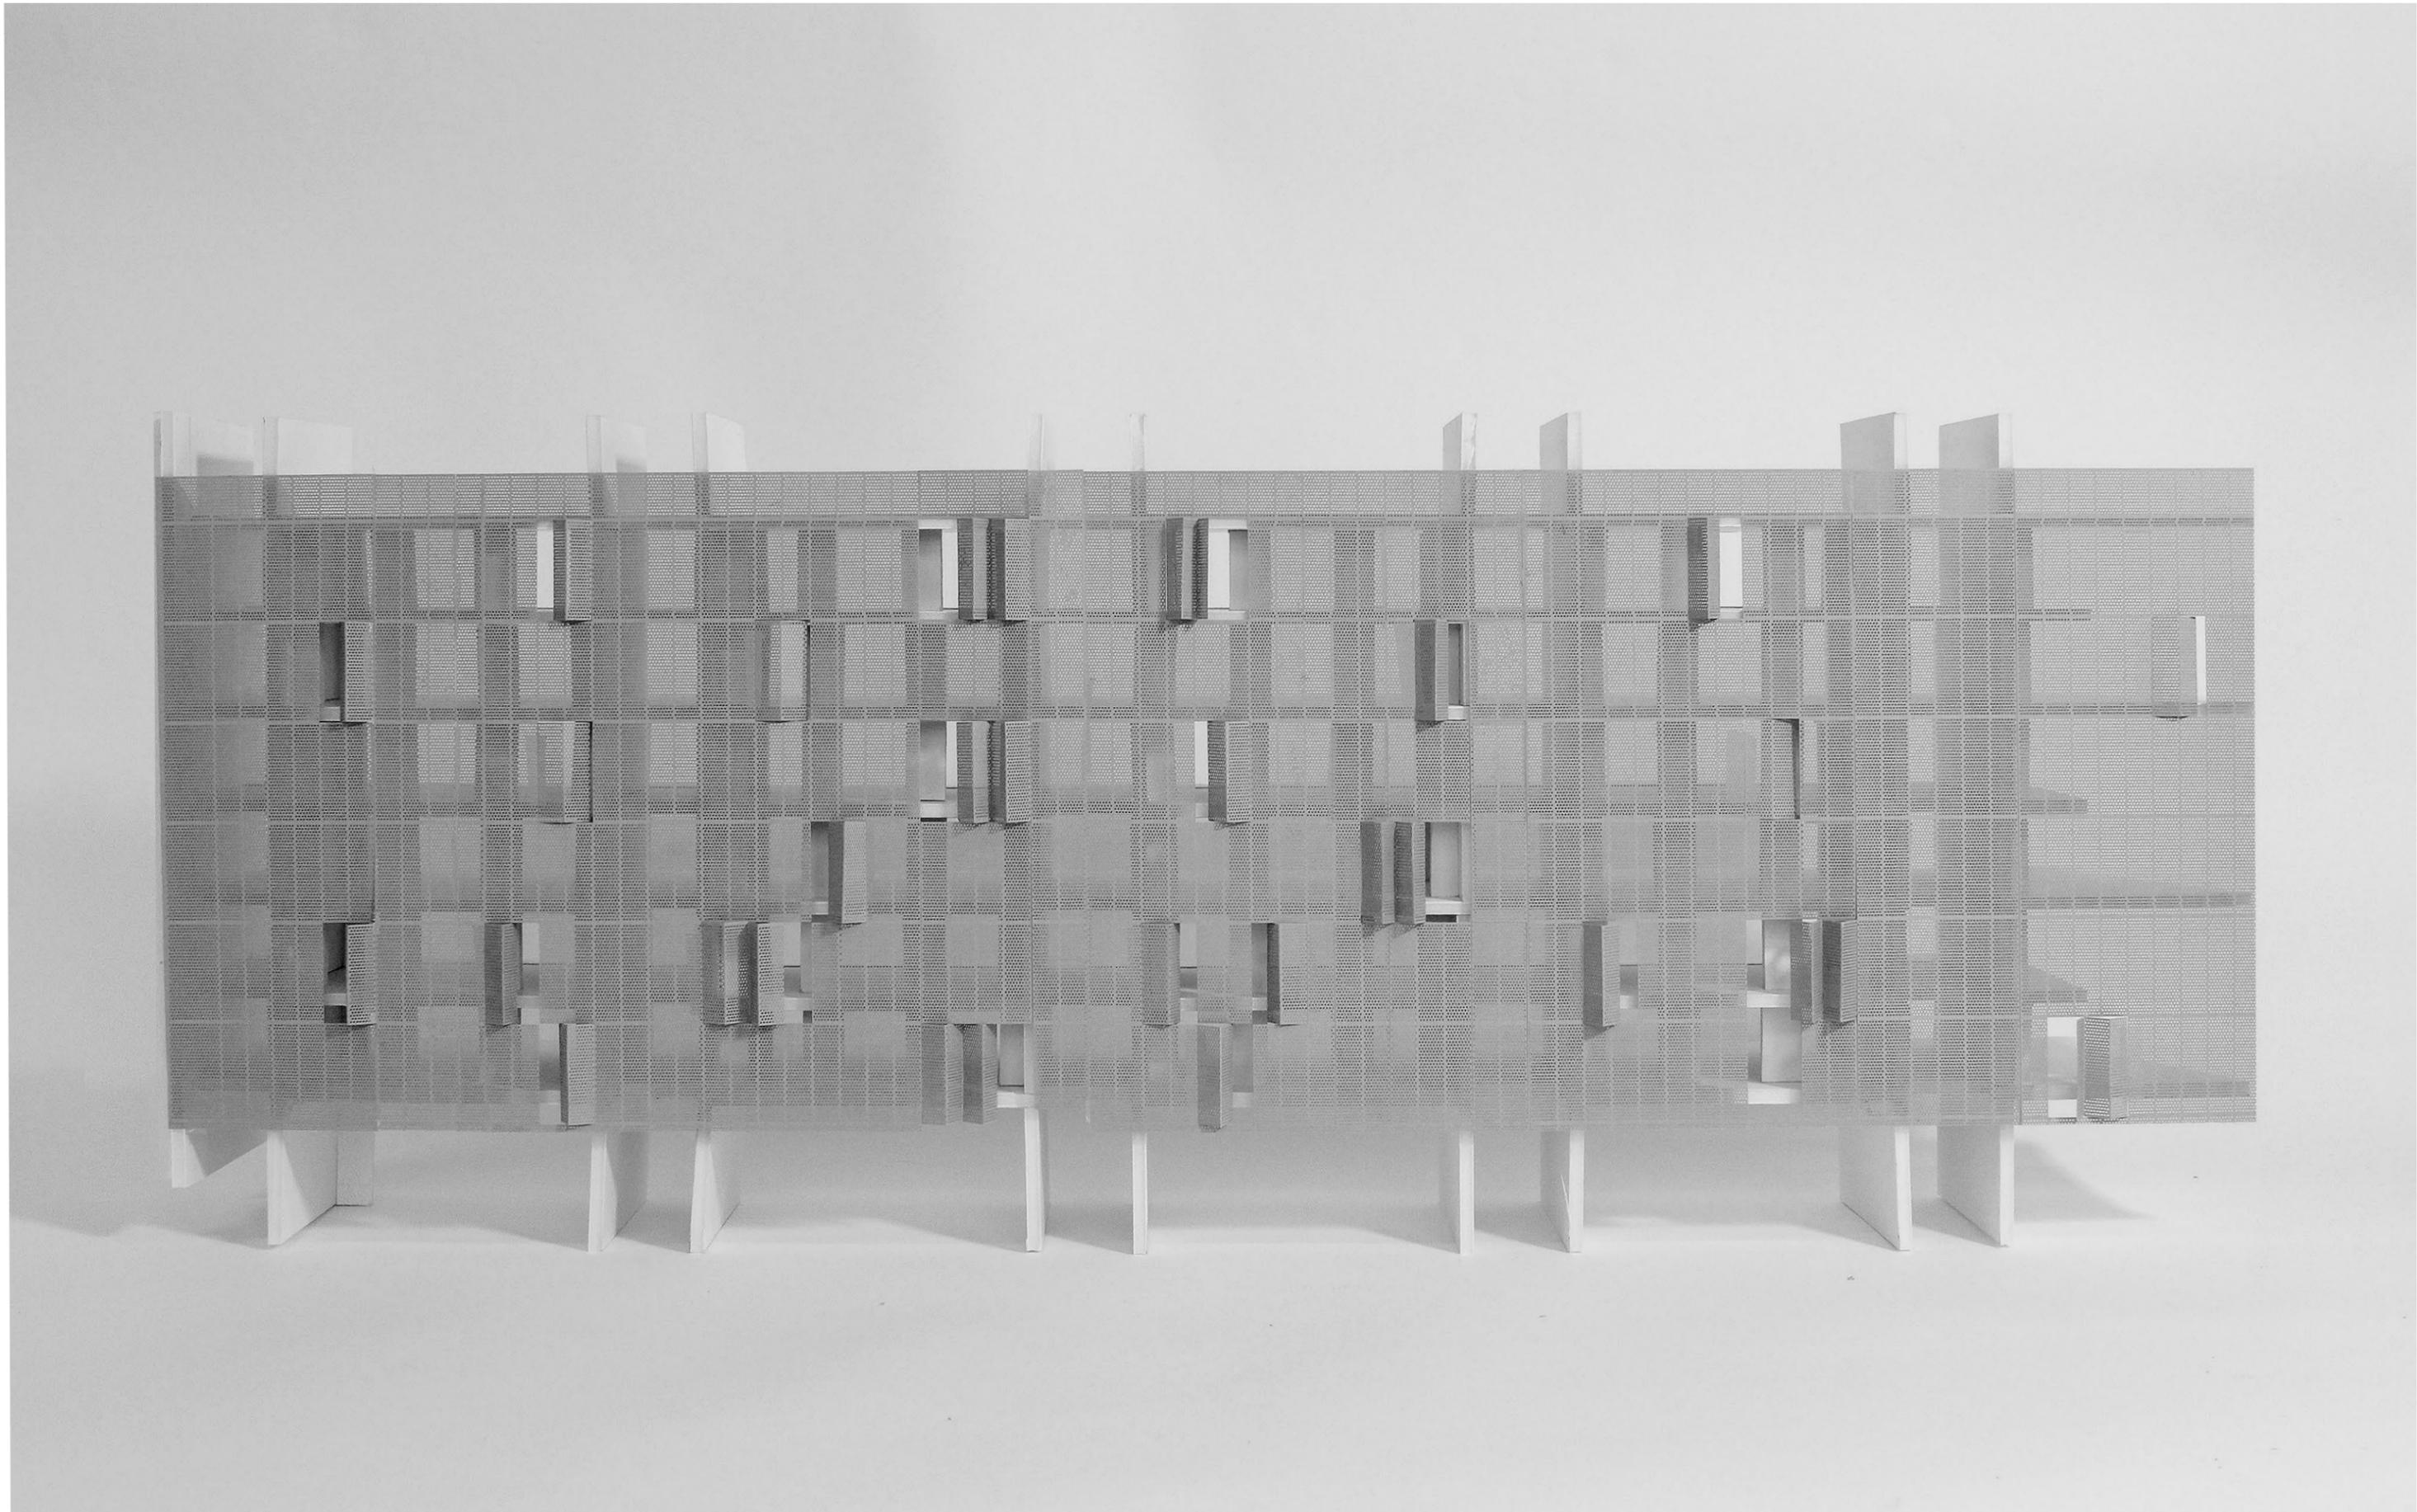

The datum of the building is constant against a sloping site, creating two different conditions at each side of the block.

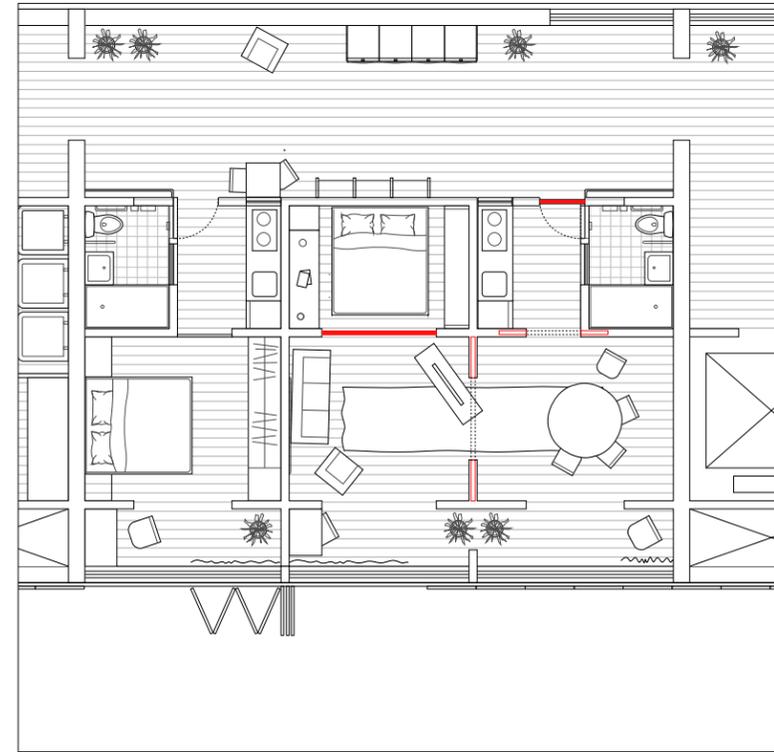

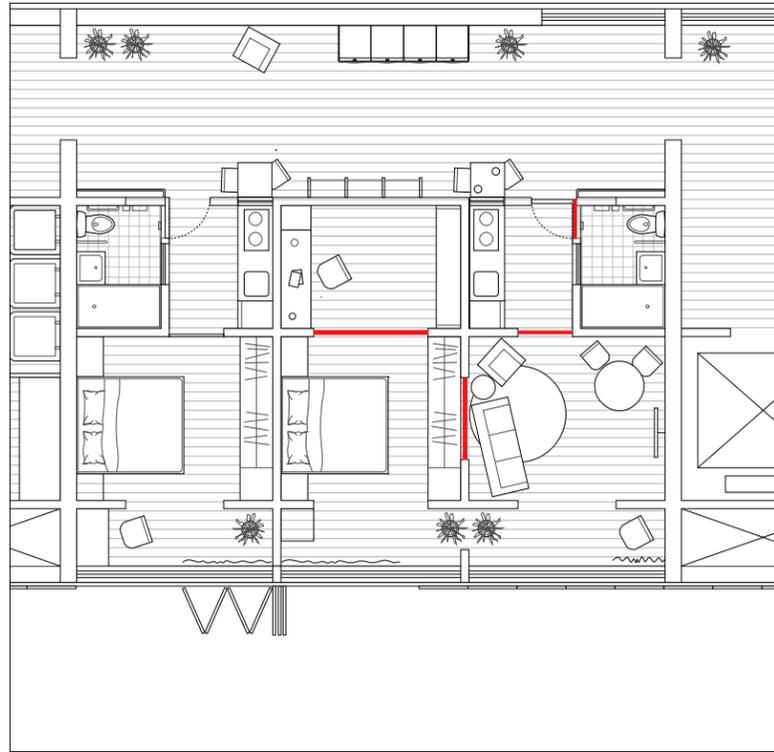

A hallway of our own

A hallway of our own

Similar to the approach of PREVI, each team of 2 students were allocated a separate parcel within the block, such that designs are smaller in scale and more precise, and the entire output of the studio is a collage of parallel proposals.

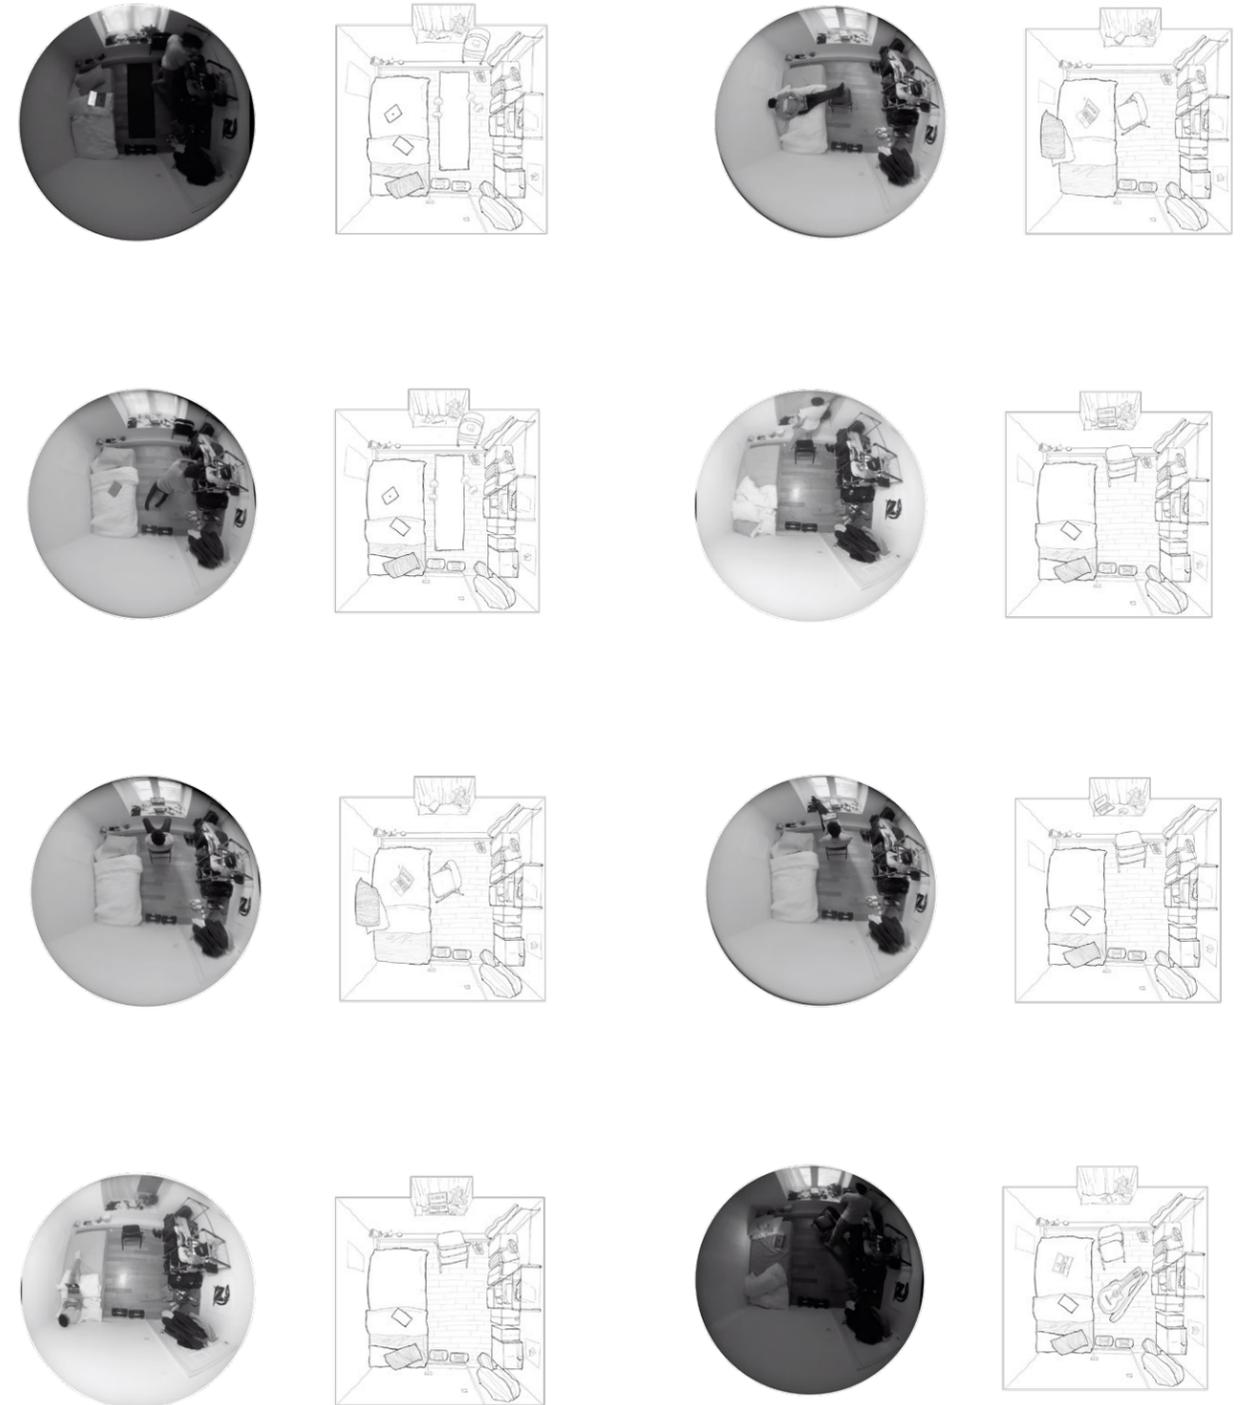

Based on insights from PREVI and other contemporary models, our studio designed housing in Bronx that that speculates on what constitutes the complete.

24 Hours

Core III Complete & Incomplete Instructor: Adam Frampton Partner: Yumeng Liu 2020

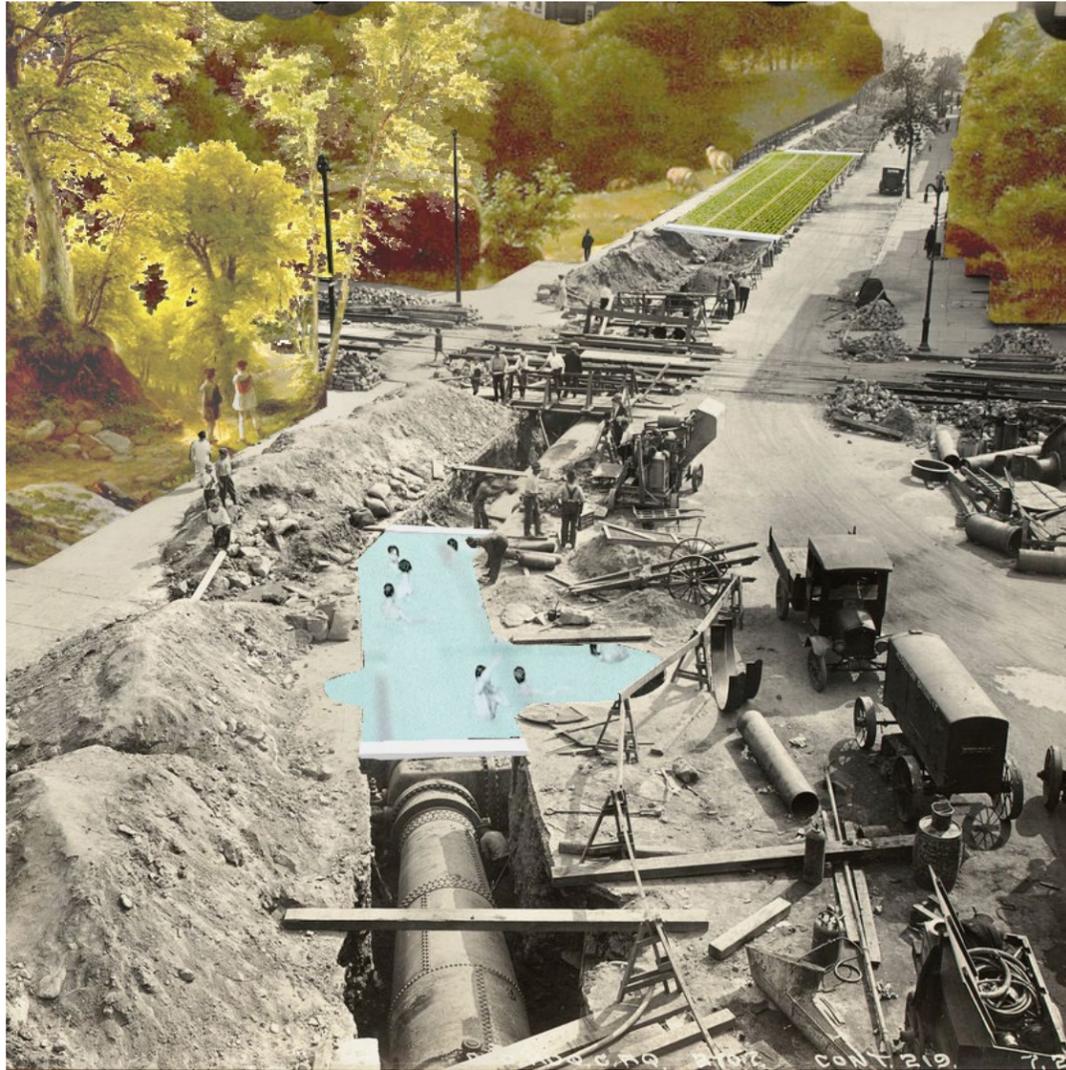

As an examination of how incomplete spaces functioned in our own dwellings, we produced a series of sketches in juxtaposed with a video of how my 4 foot deep window sill, changed throughout the day.

So far, the window sill has served as a gym bench, a work station, a dining table, and a model building area.

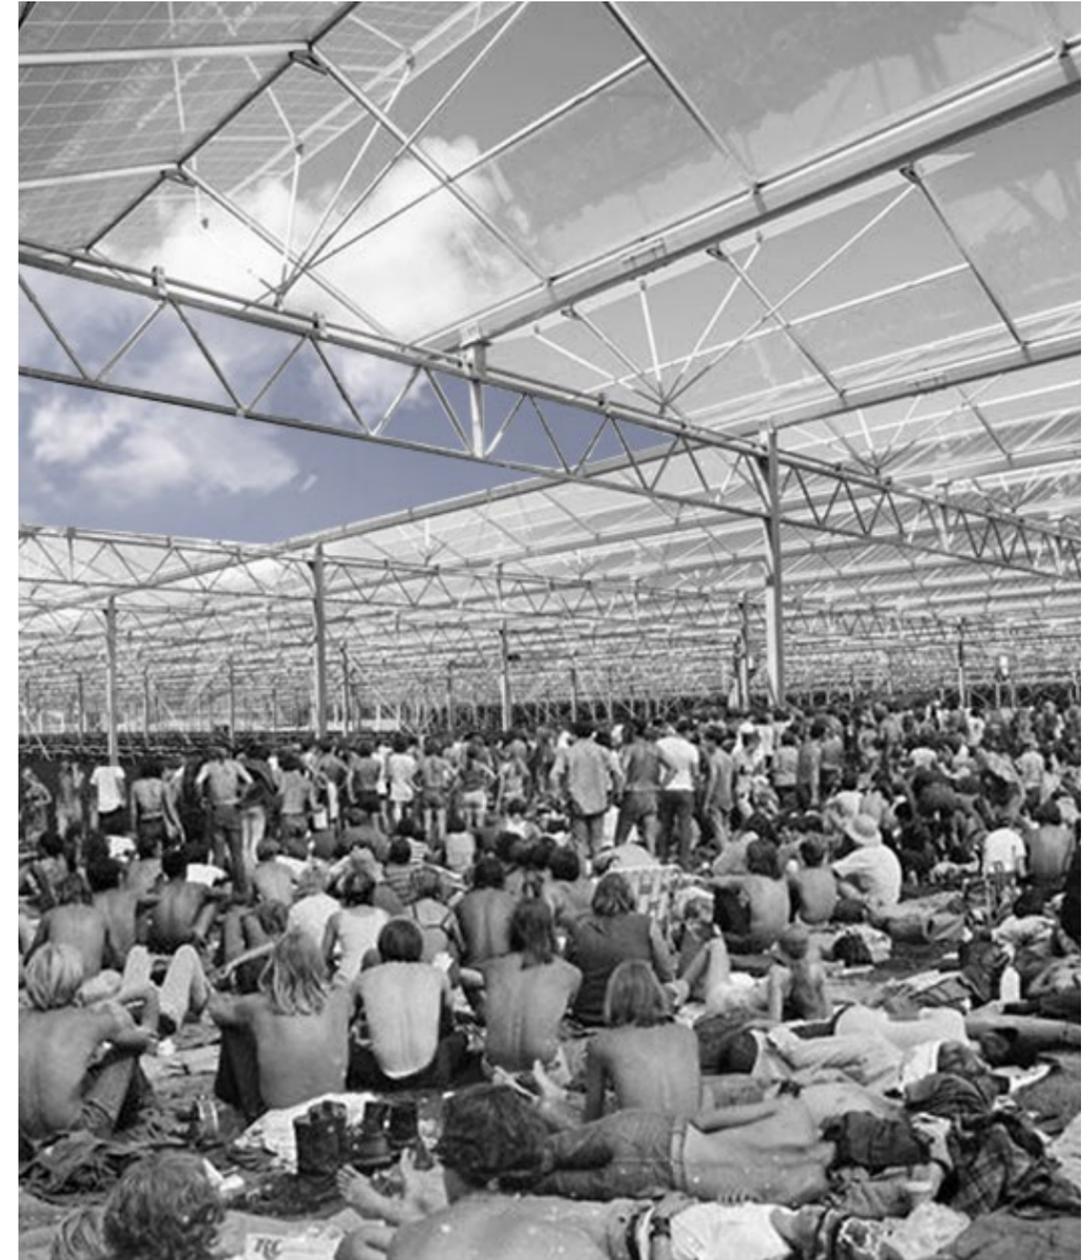

Flint Mine Solar

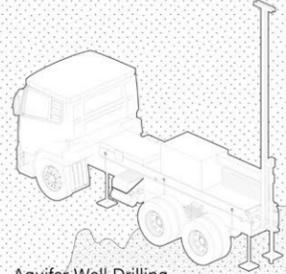

ADV IV Sanctuaries Instructor: Nahyun Hwang Partner: John Trujillo 2021

This project positions massive urban infrastructure as a form of nature, a scaffold that becomes an opportunity for making

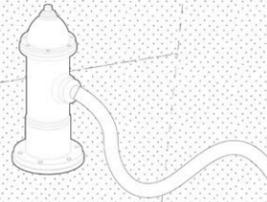

industrial scale technology visible and accessible. It scales it to the level of the individual.

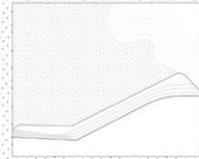

Aquifer Well Drilling

Often, residential wells are drilled, which requires the use of a complicated and costly drill rig usually mounted on big trucks. Drilled wells can reach more than 1,000 feet deep.

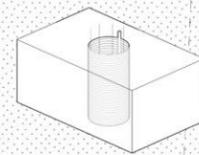

Aquifer Pump

Often a pump is placed in the drilled well at some depth to push the water up to the surface. And into a storage tank.

Olivebridge Dam

The Ashokan Reservoir was created by a series of dams, constructed between 1907 and 1915 by the New York City Board of Water Supply, which impounded the Esopus Creek. This move led to the submersion of thousands of acres of farmland, displacing two thousand residents located in the surrounding valley.

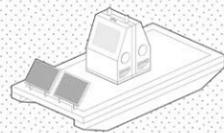

Inspection Shaft 5B

Located at the start and end of a pressure tunnel segments underneath the Hudson River, inspection shafts allow personnel access directly into the aqueduct.

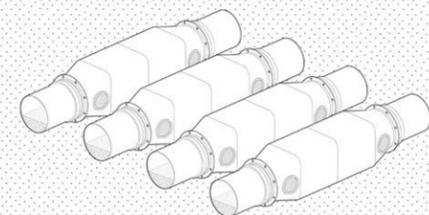

Delaware Aqueduct

The Catskill and Delaware Aqueducts feed into the Kensico Reservoir, where robotic buoys transmit information about water quality. Chlorine, which kills bacteria, and fluoride, for dental health, are added.

Infrastructures serving New York City are entangled with smaller communities in the Hudson Valley and often come into conflict with the scale of smaller communities.

The Flint Mine Solar Power Plant, in the Hudson Valley, is the largest solar power plant in the East United States. Much of the controversy surrounding the construction of the plant has focused on its disturbance of the bucolic scenery that Greene county residents envision for their community.

We imagine a series of cabins that can host both on the first lot. Per the soil analysis, the apple orchards were placed to the west and north east. These areas are divided by wetland or road from manufacturing or residential areas. By manufacture we mean a cider distillery that we imagine will extend the life of this community past the season of harvesting the apples and attract visitors and income year round.

Project Title

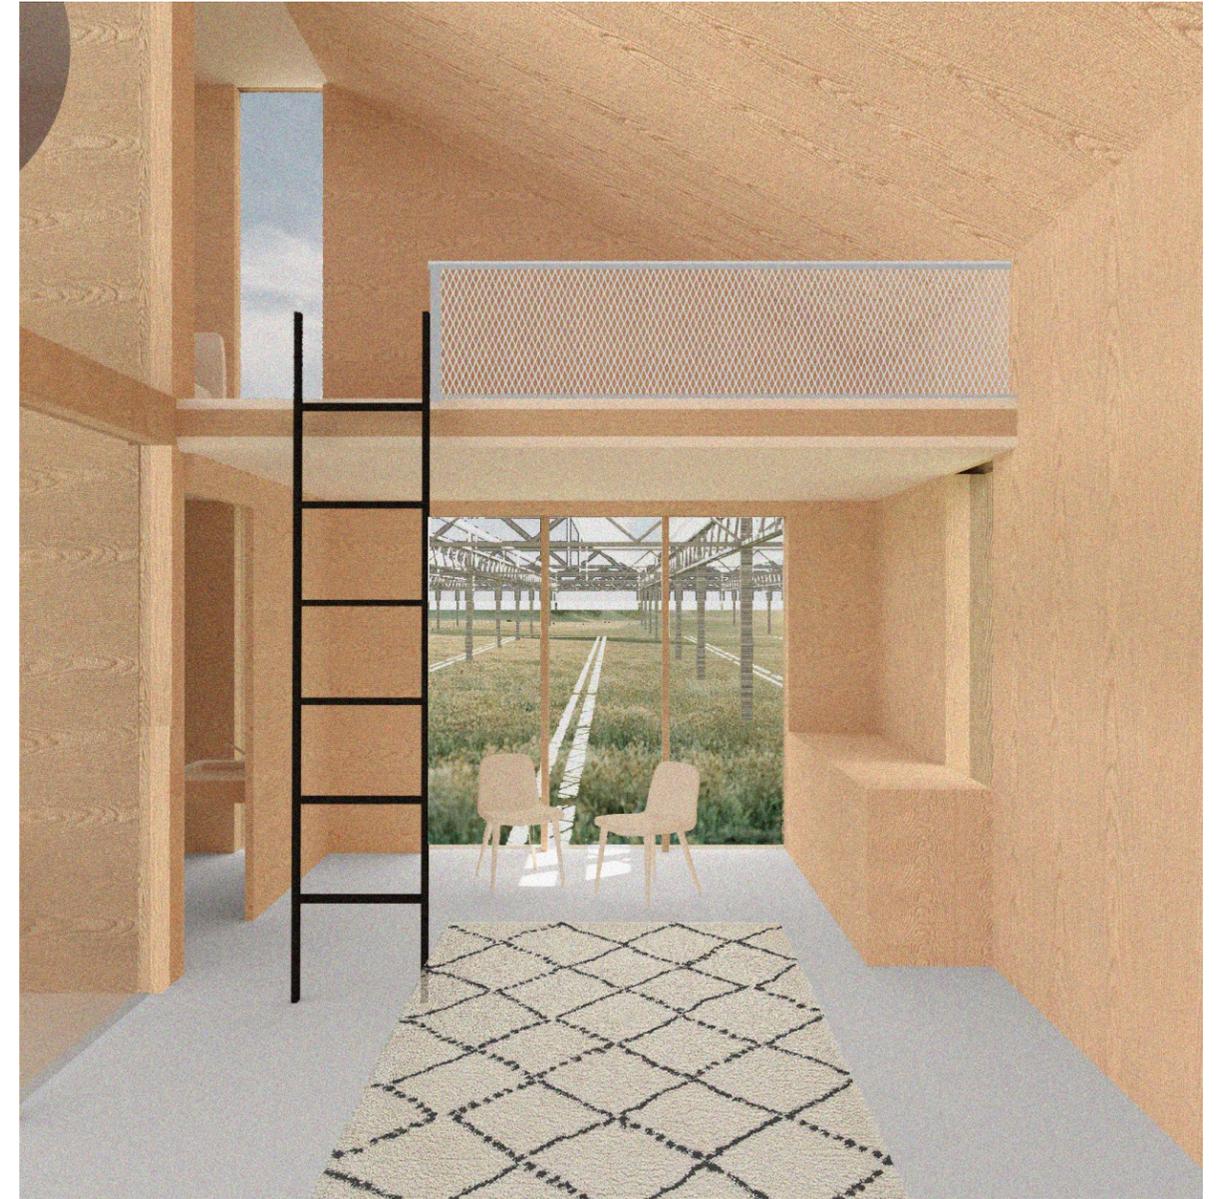

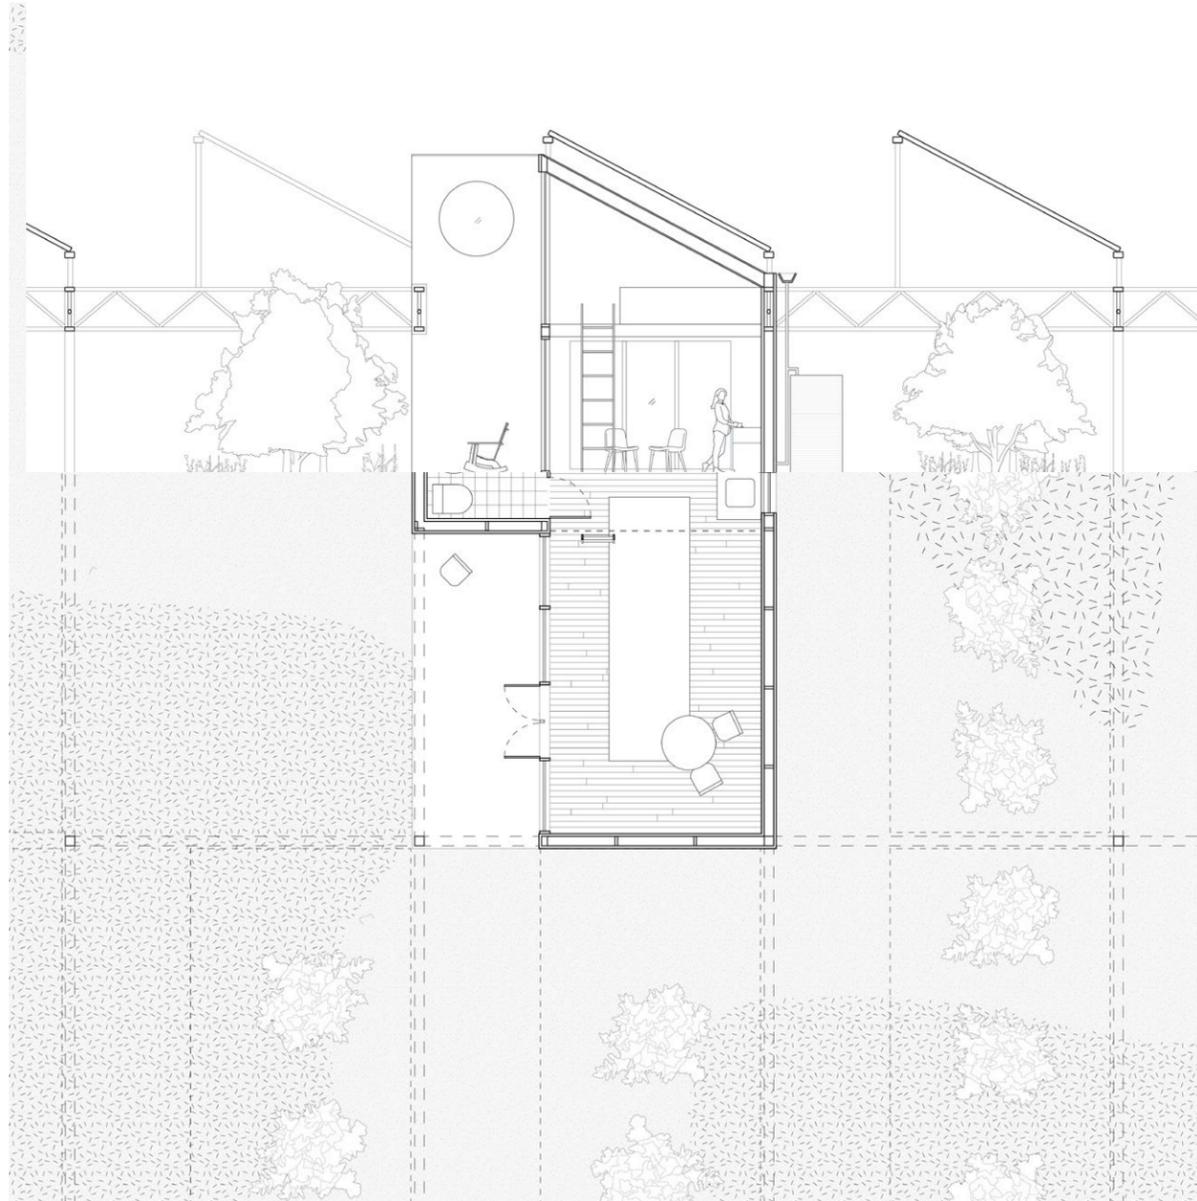

A hallway of our own

The next lot sites two communities: First, it reverses the typology of the woodstock and maverick artist sanctuaries in the 1920s shown in this catalog entry, where originally production was communal and housing individual. We plan for the opposite part of our site.

How considerations of the slope of the solar panel result in a loft space at the second level, and how some solar panels can be curated to allow for exterior light wells.

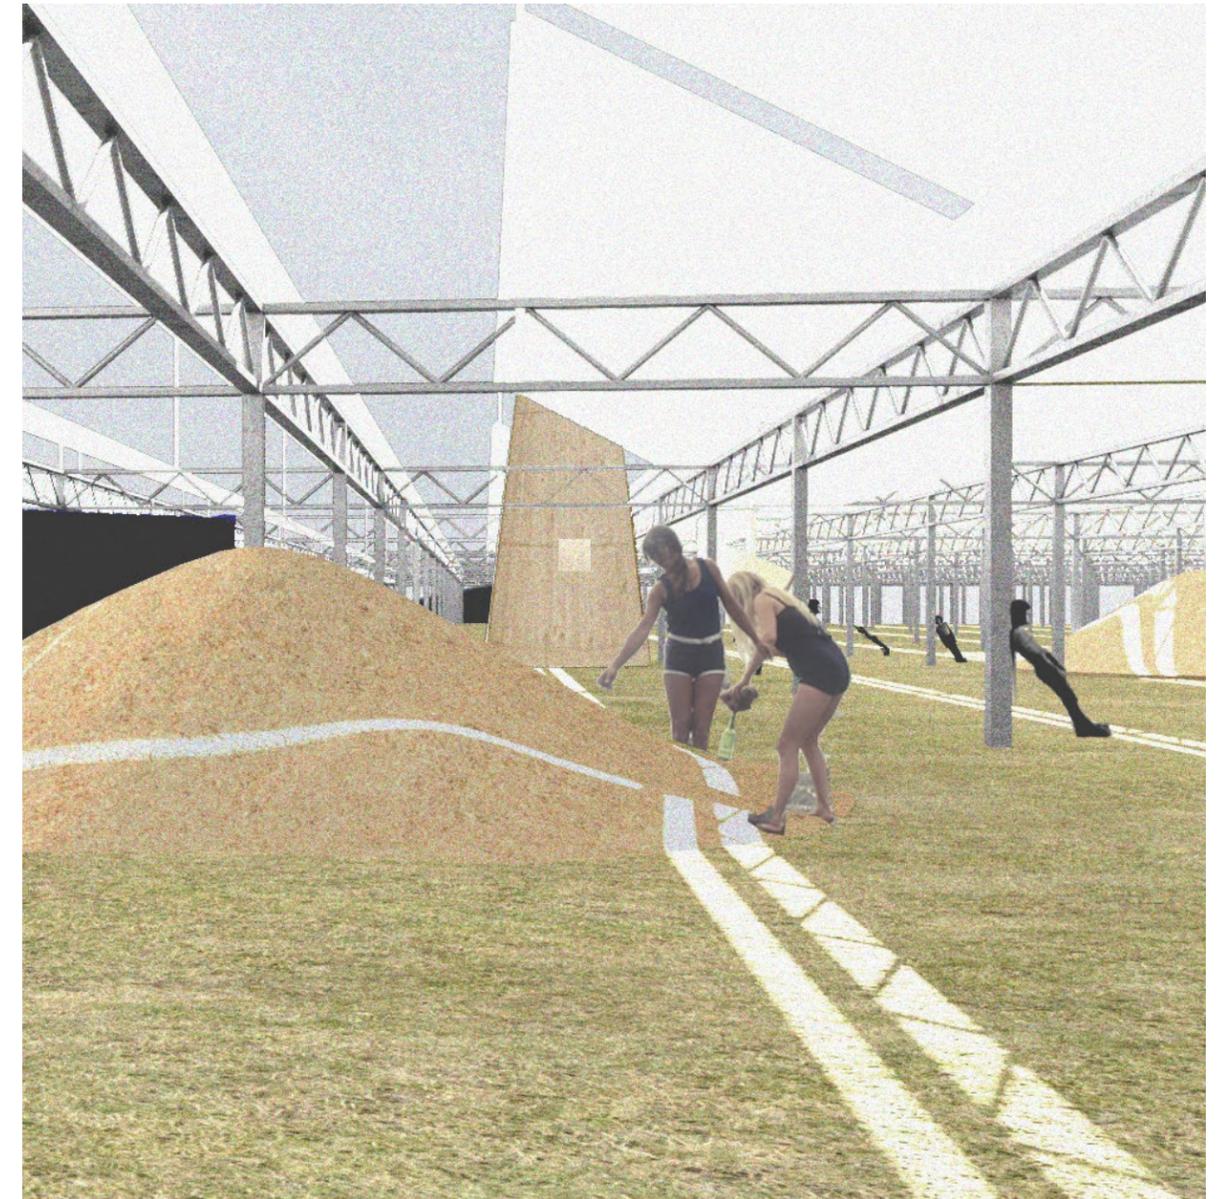

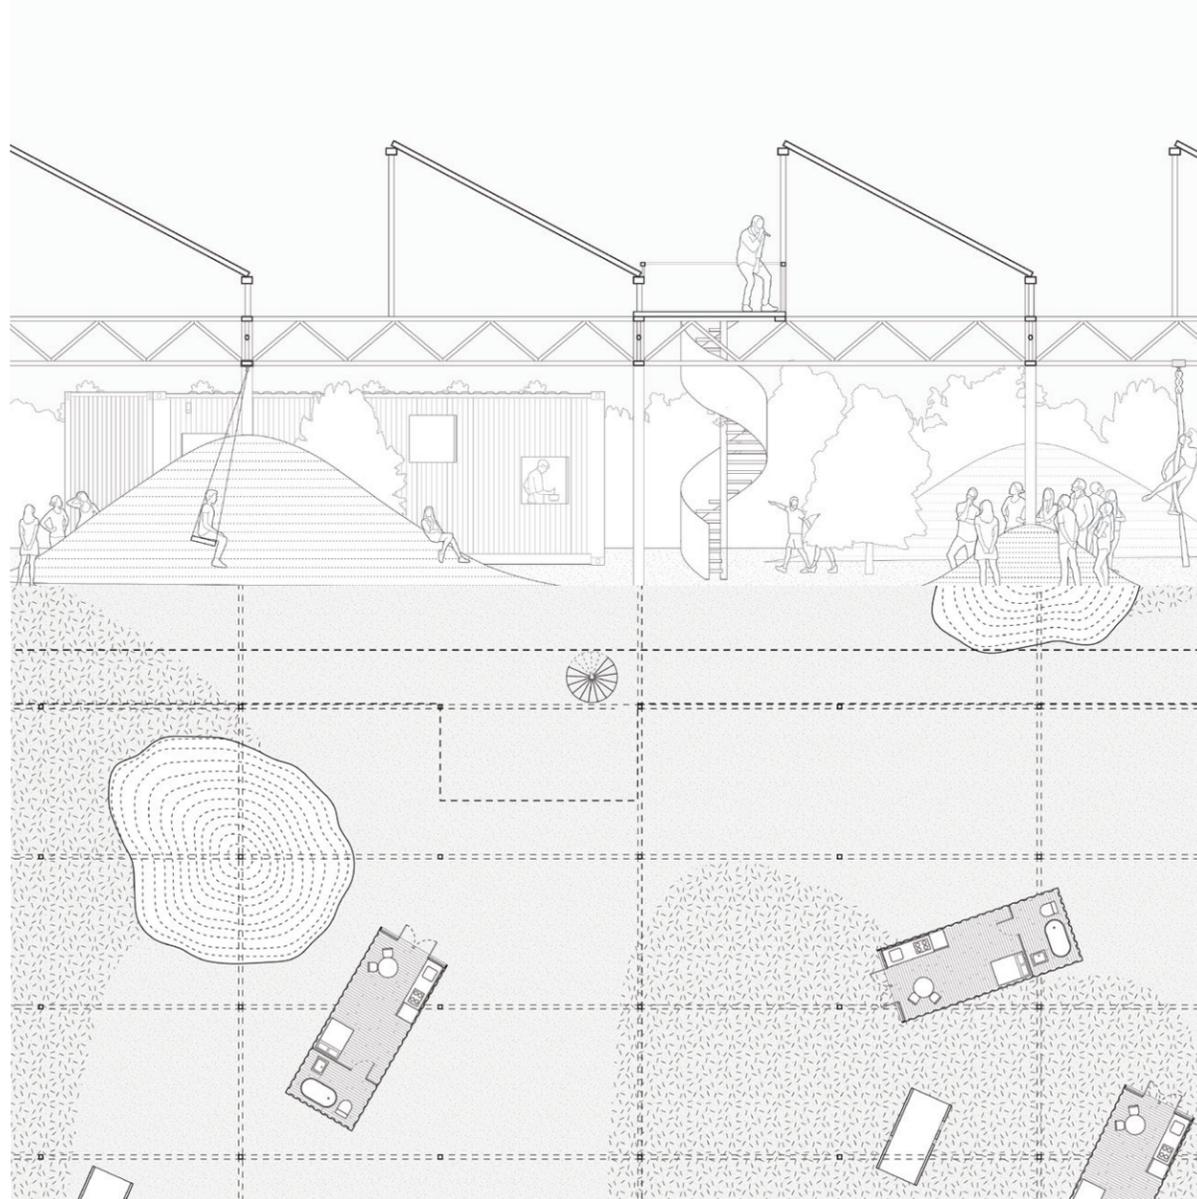

Project Title

A hallway of our own

A community that is informal and preformative, attracting an audience akin to that of the woodstock concert in the late 60s, but less temporary. Referencing the Halprin workshops, one that can incorporate the land and topography into their art.

Ecosystems of Dissent

ADV V un-Detailing Andrés Jaque Partners: Aya Abdallah & Osvaldo Delbrey

With the development of corporate telecommunication buildings around the world, infrastructural systems have been concealed for the sake of progress, limiting them to the realm of experts.

By eliminating entire material narratives, these corporations became active participants in the production and centralization of secrecy and power.

un-DETAILING

un-DETAILING

Ecosystems of Dissent

With the development of corporate telecommunication buildings around the world, infrastructural systems have been created for the sake of progress, limiting it to the realm of experts. By eliminating entire material scenarios, these corporations became active participants in the production and centralization of secrecy and power.

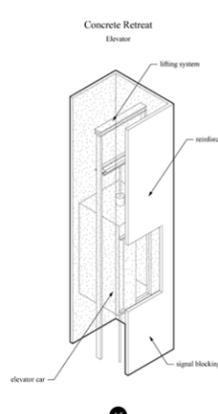

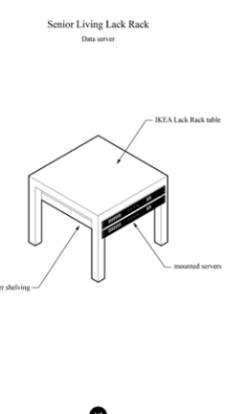

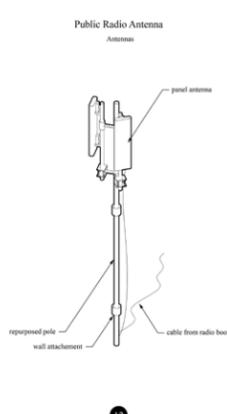

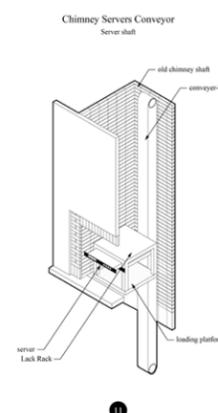

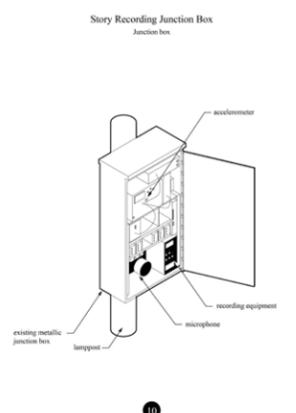

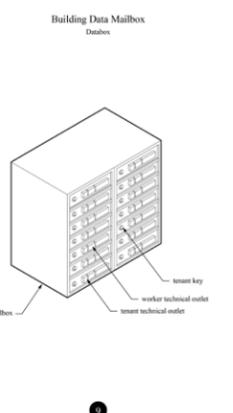

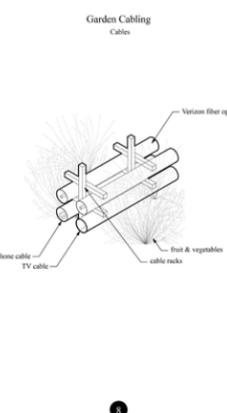

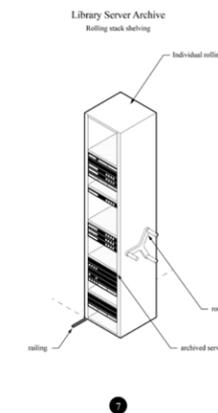

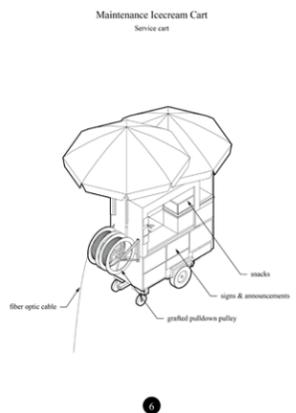

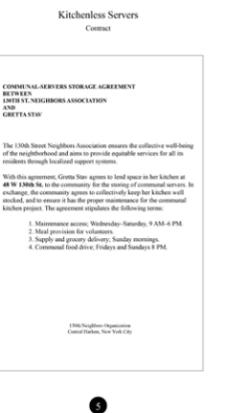

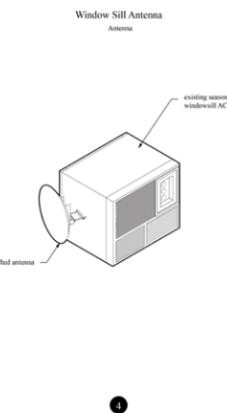

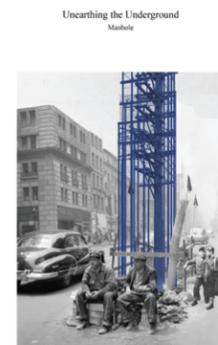

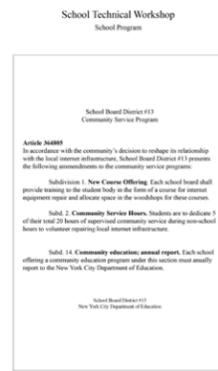

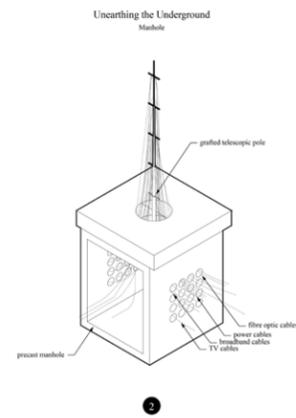

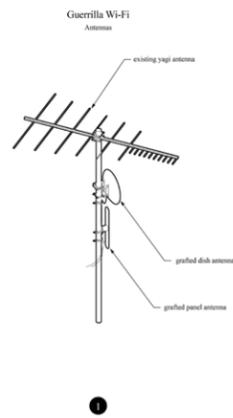

However, cracks within the system exist, and historically, opportunities of dissent were able to find their way through. Today, tracing these new obsolete spaces, elements, or systems that were removed, the current independent forms of dissent can be examined at different scales as we reorganize inefficiency as a tool to undermine the system of centralization and power in an ecosystem of dissent.

A series of interventions is proposed around the city and beyond in order to empower local communities to have more control over their own data and infrastructure. Through these independent scenarios, an attempt of un-blocking occurs, rendering visible all the successes and failures of the system.

This documentation of technical elements catalogs specific pieces of infrastructural grafting that allow for moments of dissent.

This pamphlet is meant to be read simultaneously alongside the printed map of NYC and the modeled scenarios.

ADV Studio V - Fall 2021 - Aya Akhaddi, Naveed Ali Sahban, Ousama Bahmy Omer

A Second Cyborg

Kitchenless Stories

Instructor: Anna Puigjaner

2021

This essay interrogates Donna Haraway's *Cyborg Manifesto*, and re-examines the 'cyborg' through the innocuous ways in which technological infrastructure operates.

(Excerpt)

In September of 1960, two NASA engineers, Manfred Clynes and Nathan Kline, defined the neologism *cyborg* in their essay "Cyborg and Space" as a synthesis of organism and machine.¹ Even before the word was coined, popular culture had already been saturated with fictional images and stories of the cyborg as a figure; novels and movies imagined a new form of fantastical being which, by its very existence, stood in opposition to the traditional boundaries defined by the human subject.²

In September of 1960, at NASA's Langley Research Center, Katherine Johnson performed computing runs for the country's first manned space program: Project Mercury.³ Johnson and her colleagues at Langley constituted a black female workforce called computers. They were tasked with completing the mathematical calculations and technological management necessary for the system to operate.⁴ Despite how essential the work of the computers was to the success of NASA's space aspirations, their contributions have largely been overlooked. Their labor, despite its necessity, was viewed as mechanical and was undervalued. This view of the

computers as “machines” was reflected in their working conditions and the spaces in which they operated. They reflected a more significant national social moment where female computers and switchers (terms which are now exclusively used to describe technological equipment) worked to maintain the technological infrastructure of the United States.

When Donna Haraway wrote *The Cyborg Manifesto* in 1984, she imagined the possibilities of socialist feminism to engage with science and technology in the context of late 20th-century capitalism through a feminist recontextualization of the term cyborg. Central to this engagement was the evolving relationship between organisms and artificiality, between humans and machines. Haraway framed the identity of cyborgs as a tool that undermined gender constructs and as having the potential to create new emancipatory social conditions. The manifesto is a socialist feminist critique on biological essentialism; she writes that the edge where the organic ends and the inorganic machine begins is constantly shifting. As lines blur, old binaries begin to fade away.

“The cyborg is a creature in a post-gender world; it has no truck with bisexuality, pre-oedipal symbiosis, unalienated labour, or other seductions to organic

wholeness through a final appropriation of all the powers of the parts into a higher unity.”⁵

However, the promise of emancipation through technology assumes that it operates in an ungendered and uniform manner. A closer analysis sees that the very details of technological infrastructure, its spaces, and the innocuous ways in which it operates produce a second form of cyborg, which rather than being emancipated by technology into occupying a post-gender world, is used for a form of underpaid, unacknowledged labor whose workforce are drawn from the lines of pre-existing socio-economic conditions. In places that are gradually becoming more hidden and harder to see, a second cyborg is drafted into invisible labor to enable the first.

Slow Canal

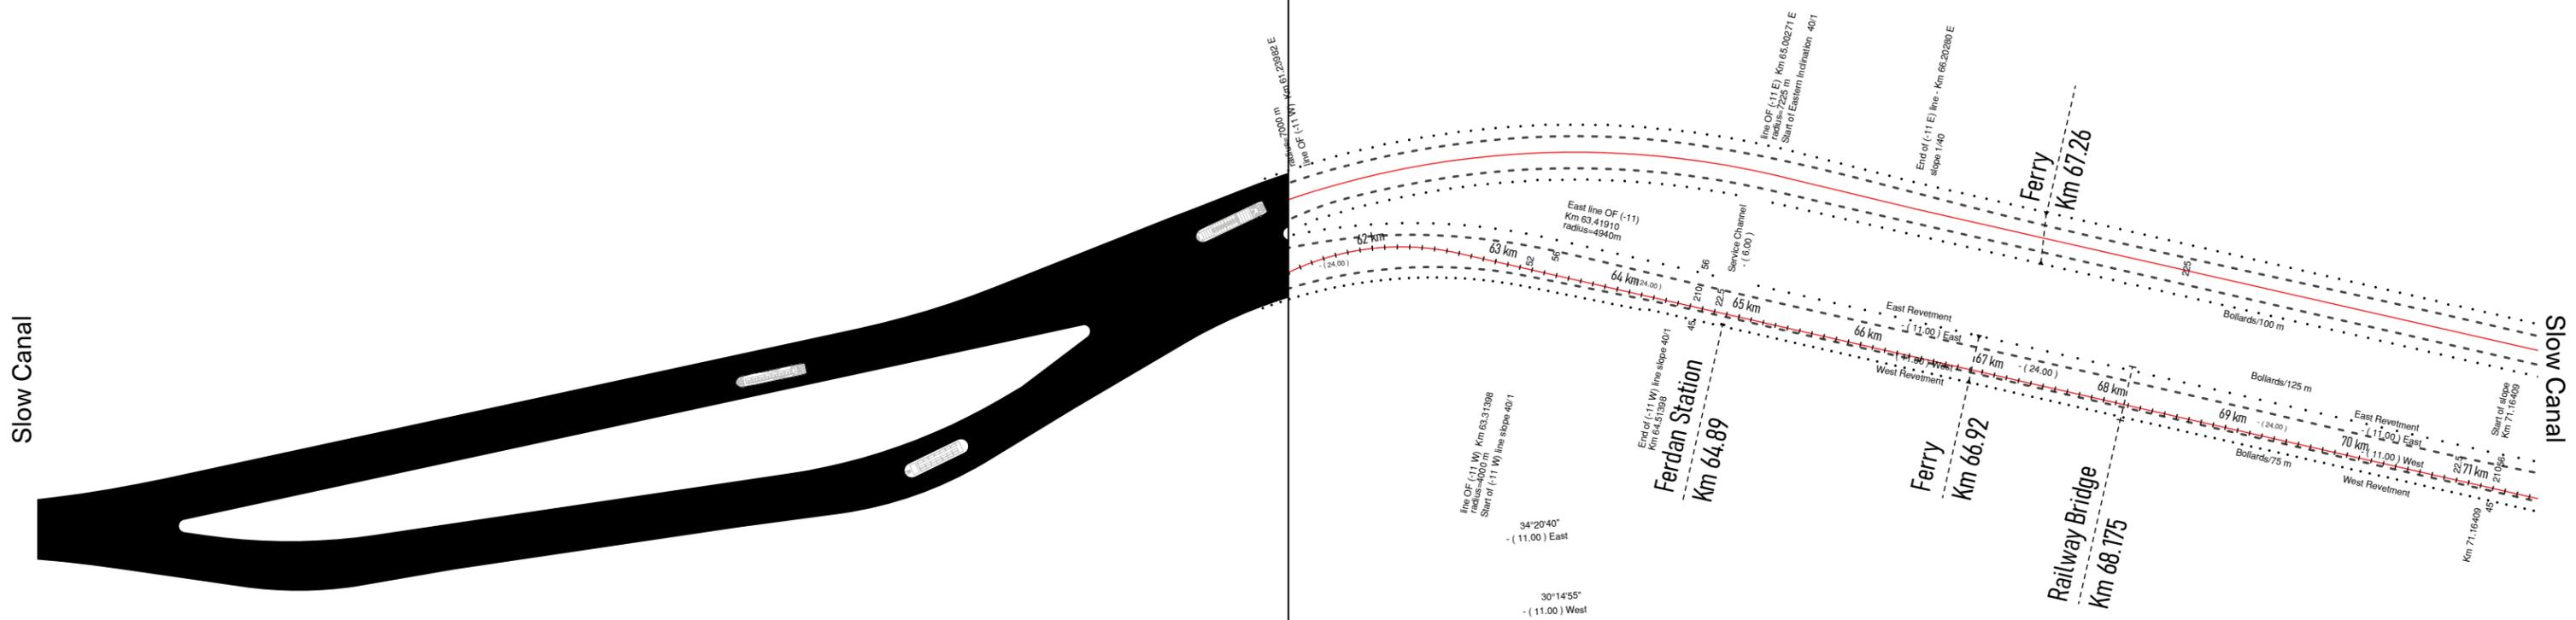

Through examining the mundane details of its logistical process, and the Historic moments where that process has been interrupted and sabotaged, we can identify a typology of circulation and interruption, and locate the objects and spaces in which that valving of power occurs.

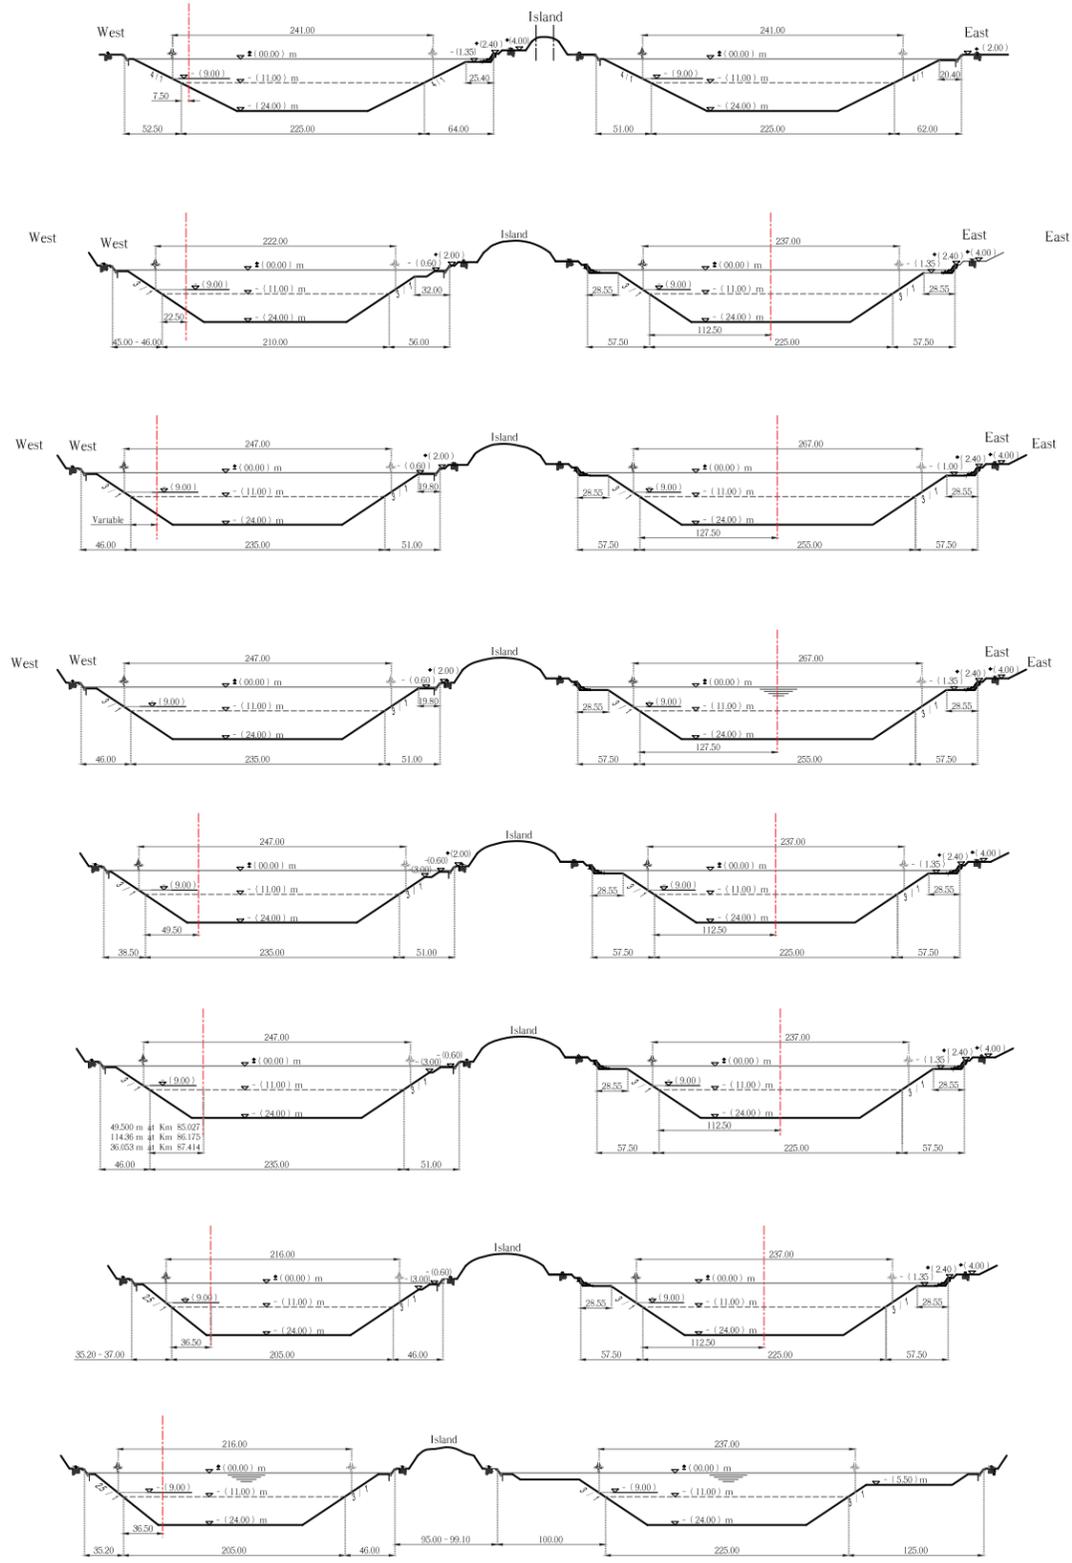

Slow Canal

When this flow is interrupted, the latent chemical energies which enable the system are released in often violent and toxic historic episodes.

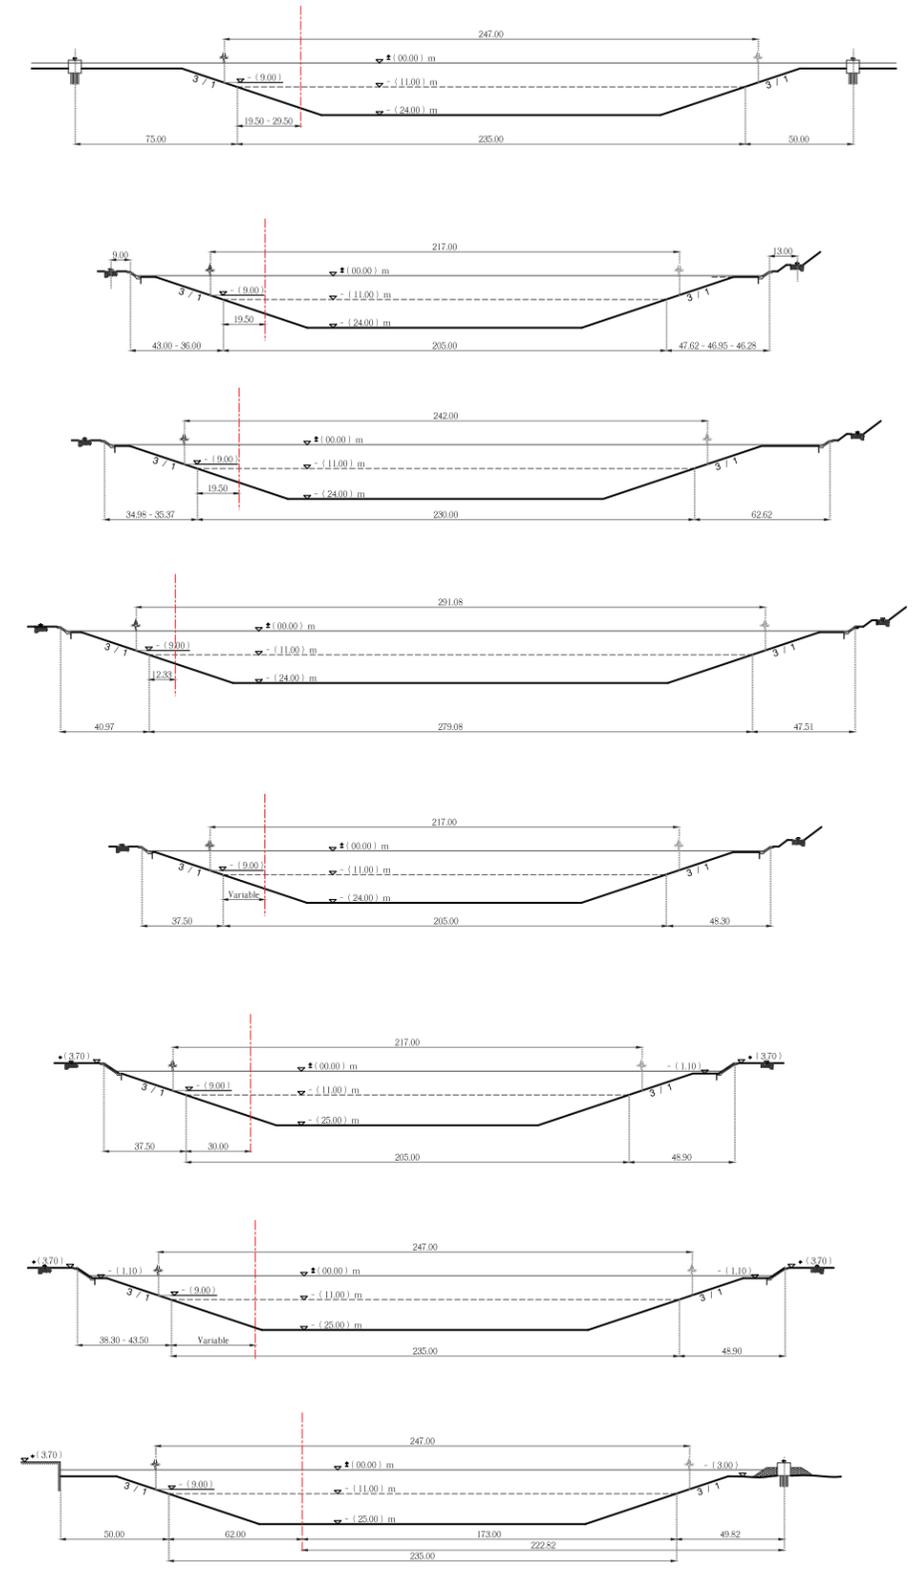

The Suez Canal not only transports petrochemicals and products; it is also charged and enabled by an abundance of chemical energy and objects. Channeled properly, this allows and facilitates global trade, and the movement of commodities.

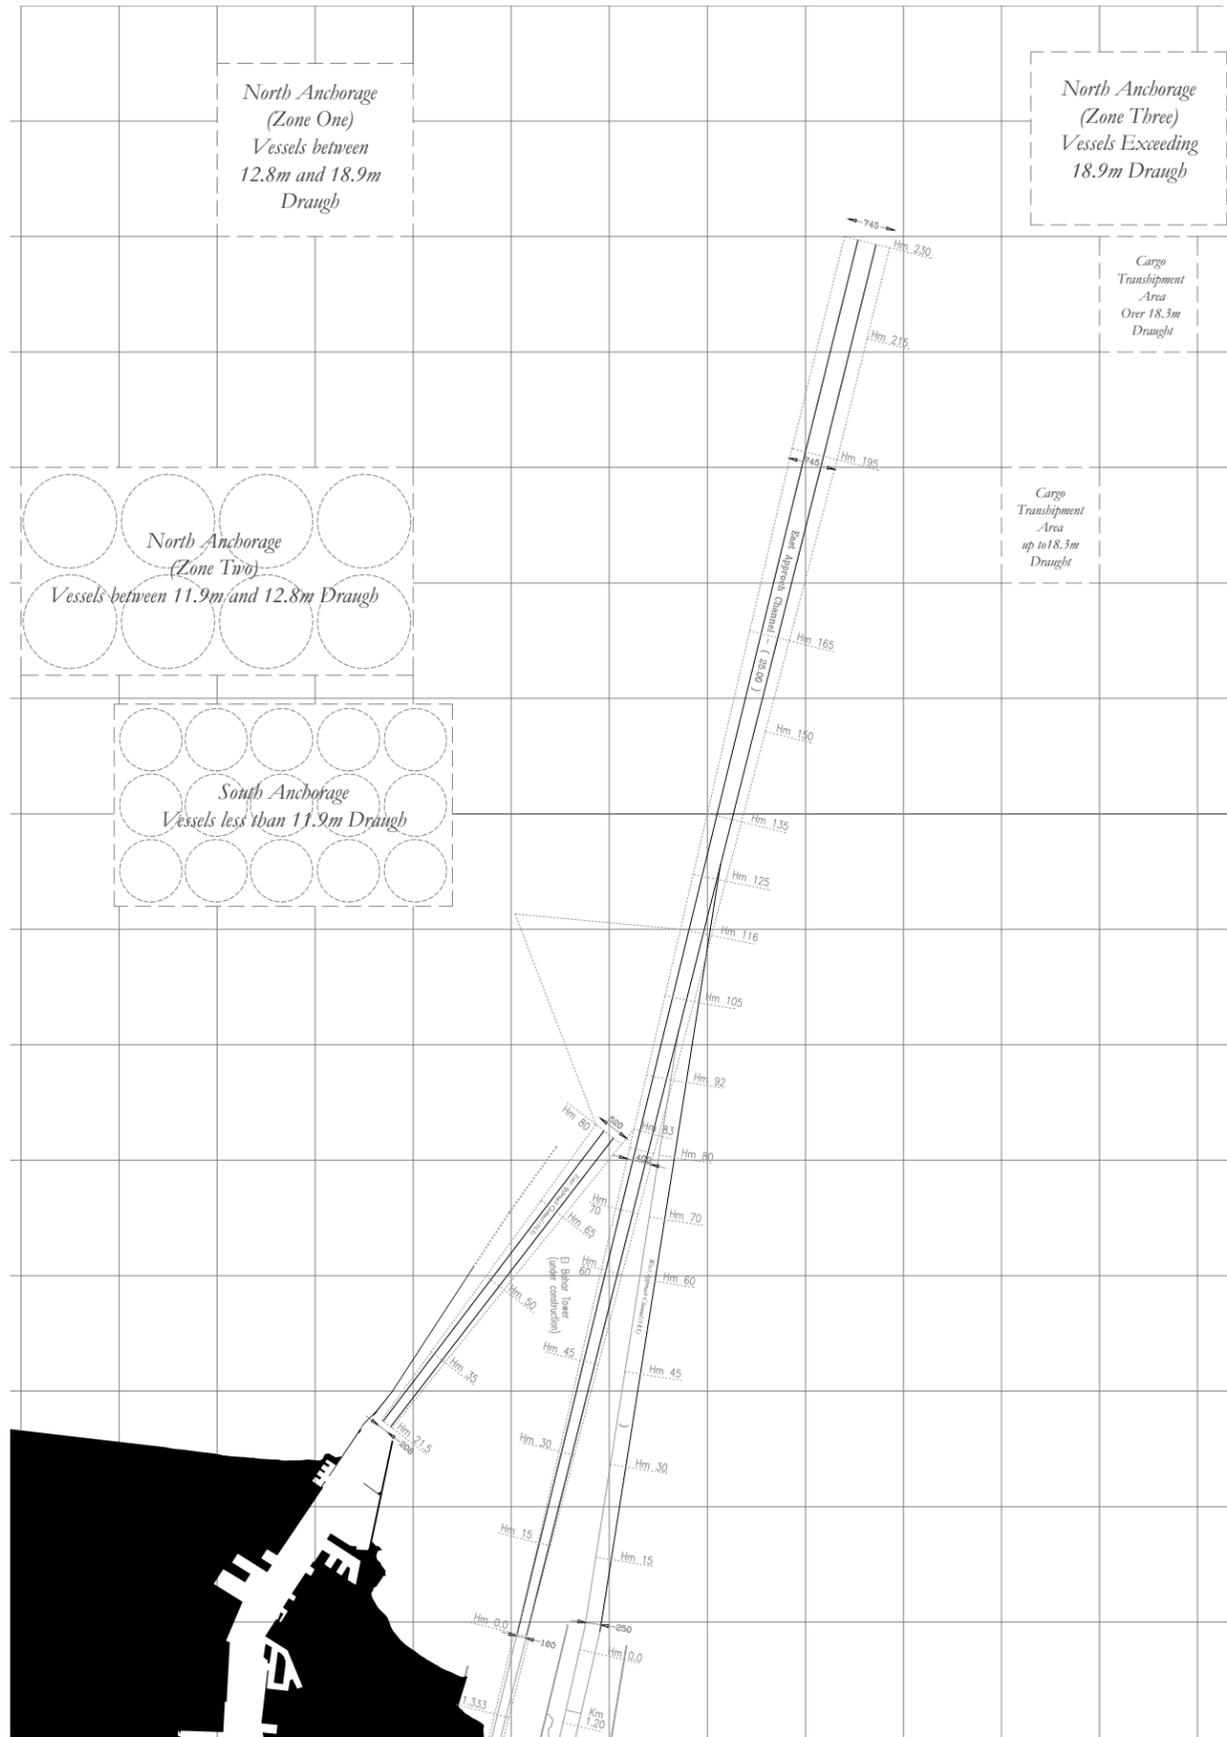

Slow Canal

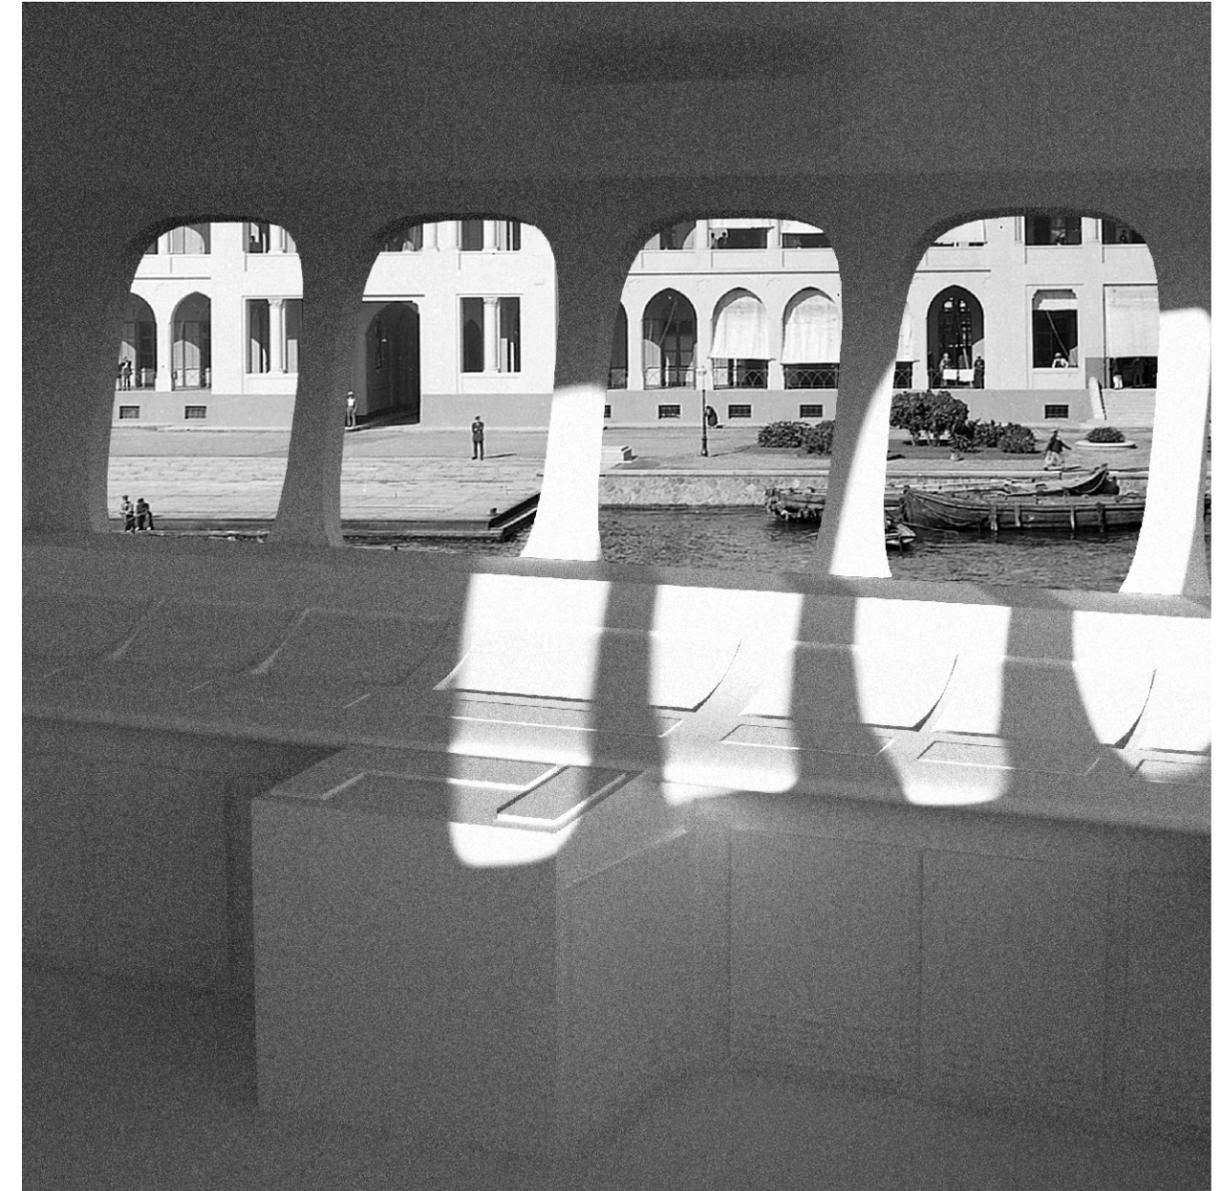

Slow Canal

Slow Canal

Slow Canal

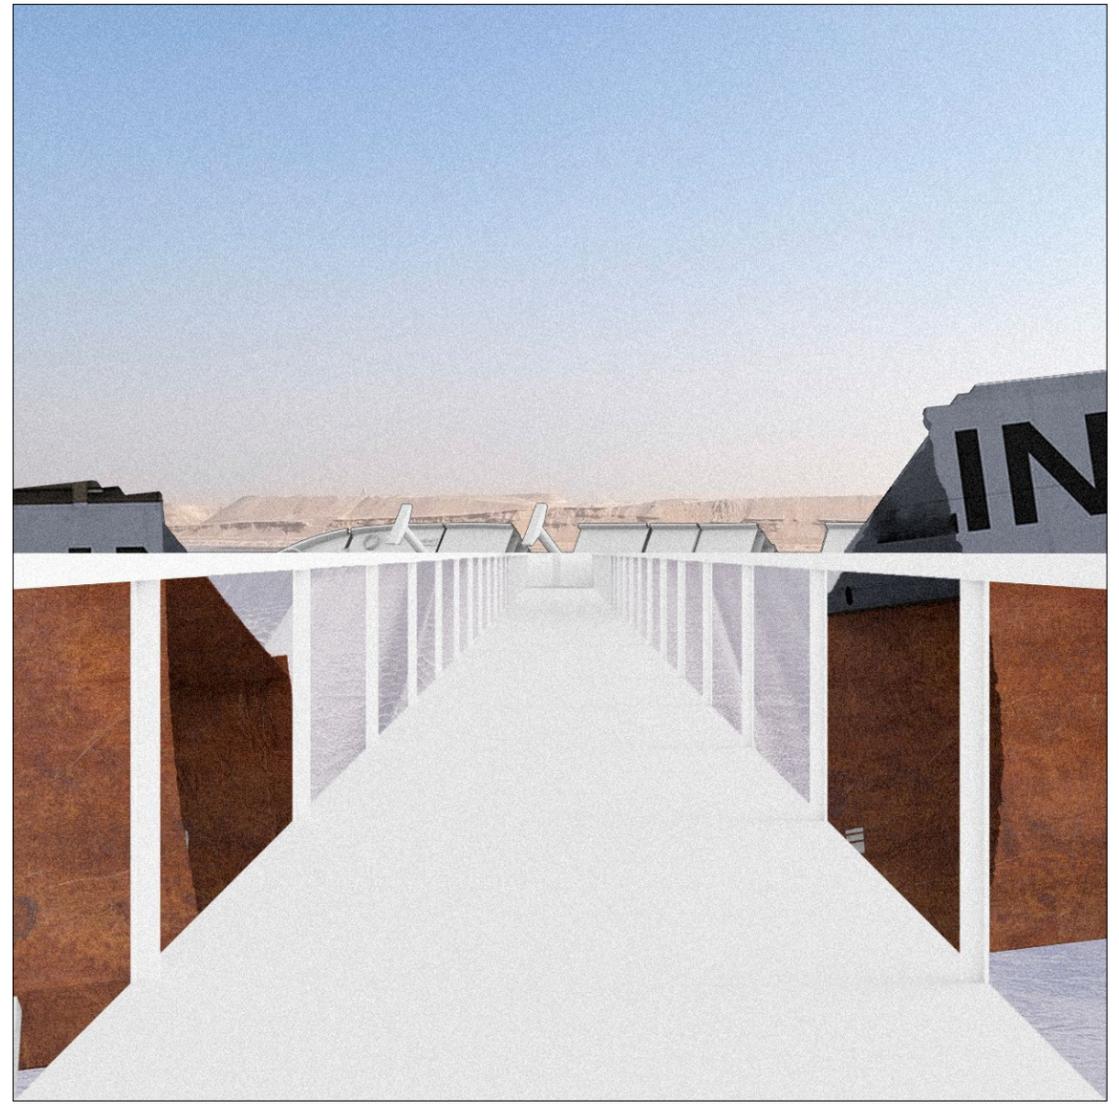

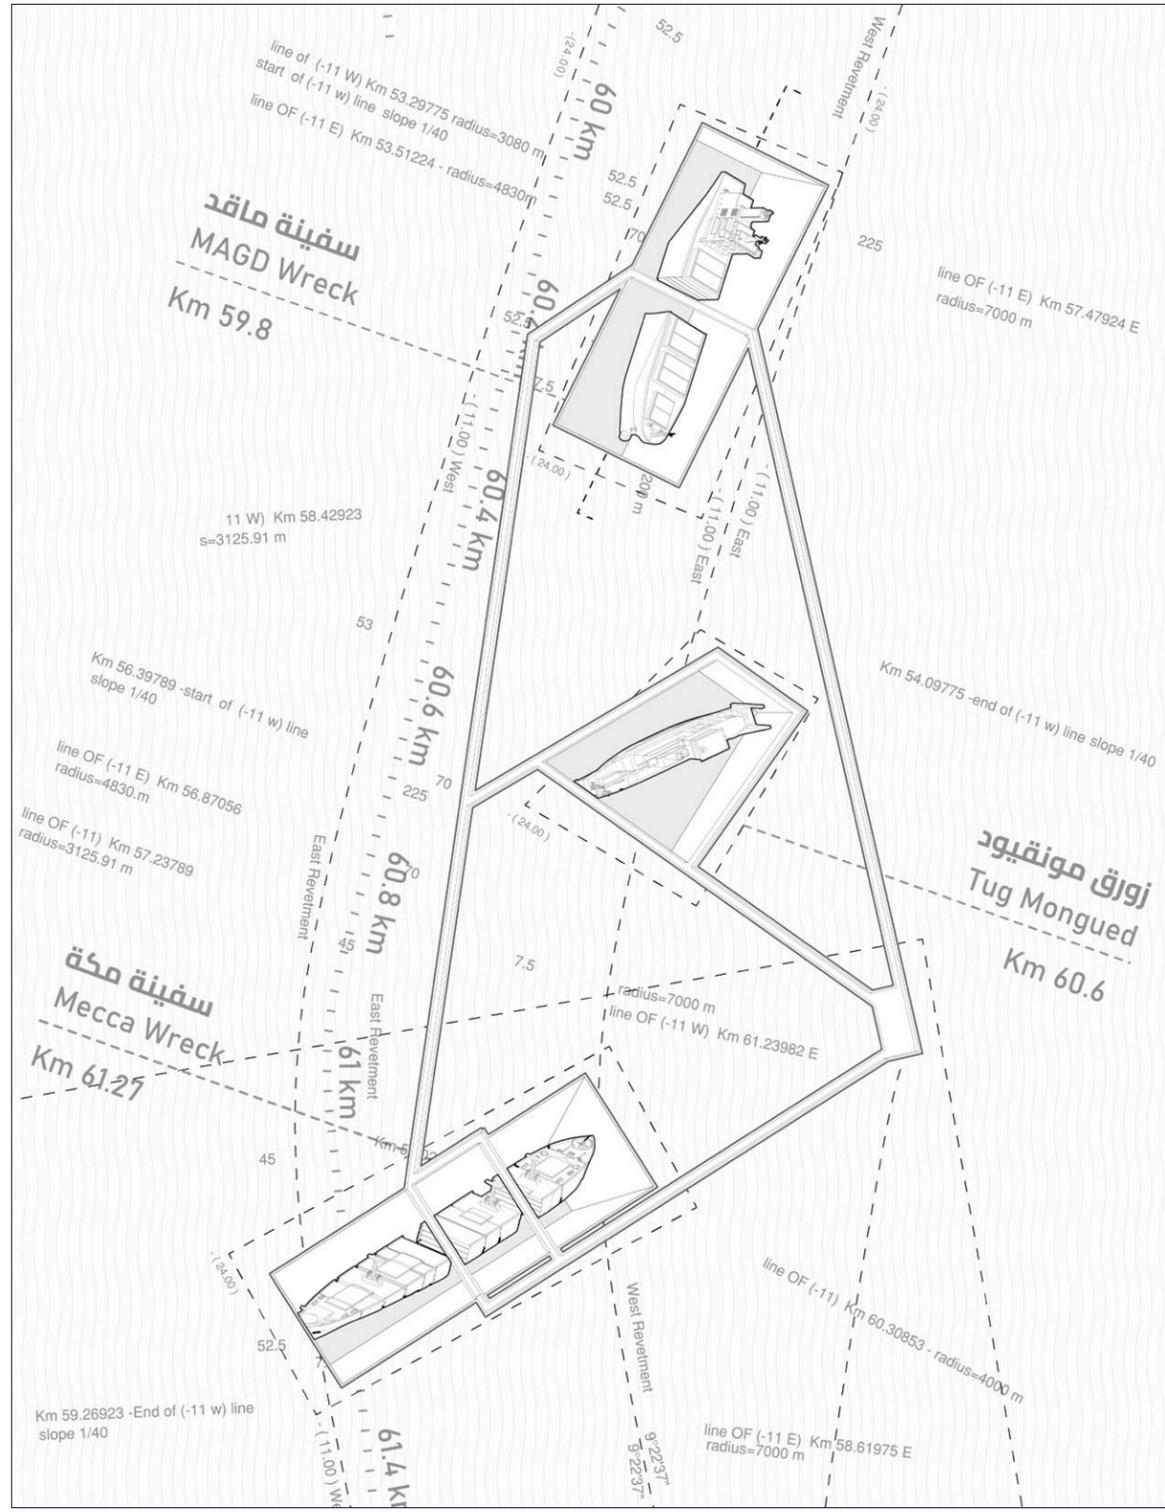

The administration of waiting,, stasis, occurs on both ends of the canal through anchorage points, By moving the administrative complexity to the center of the canal.

The canal is viewed as a simple line that is unimpeded & unquestioned. When in reality it's a fragile colonial construction, the contingency of global trade is how interruptible it is.

By re-choreographing the dimensions of circulation and redeploying the moments and tools of interruption the act of procession through the canal can commemorate moments of nationalization, violence, and sabotage.

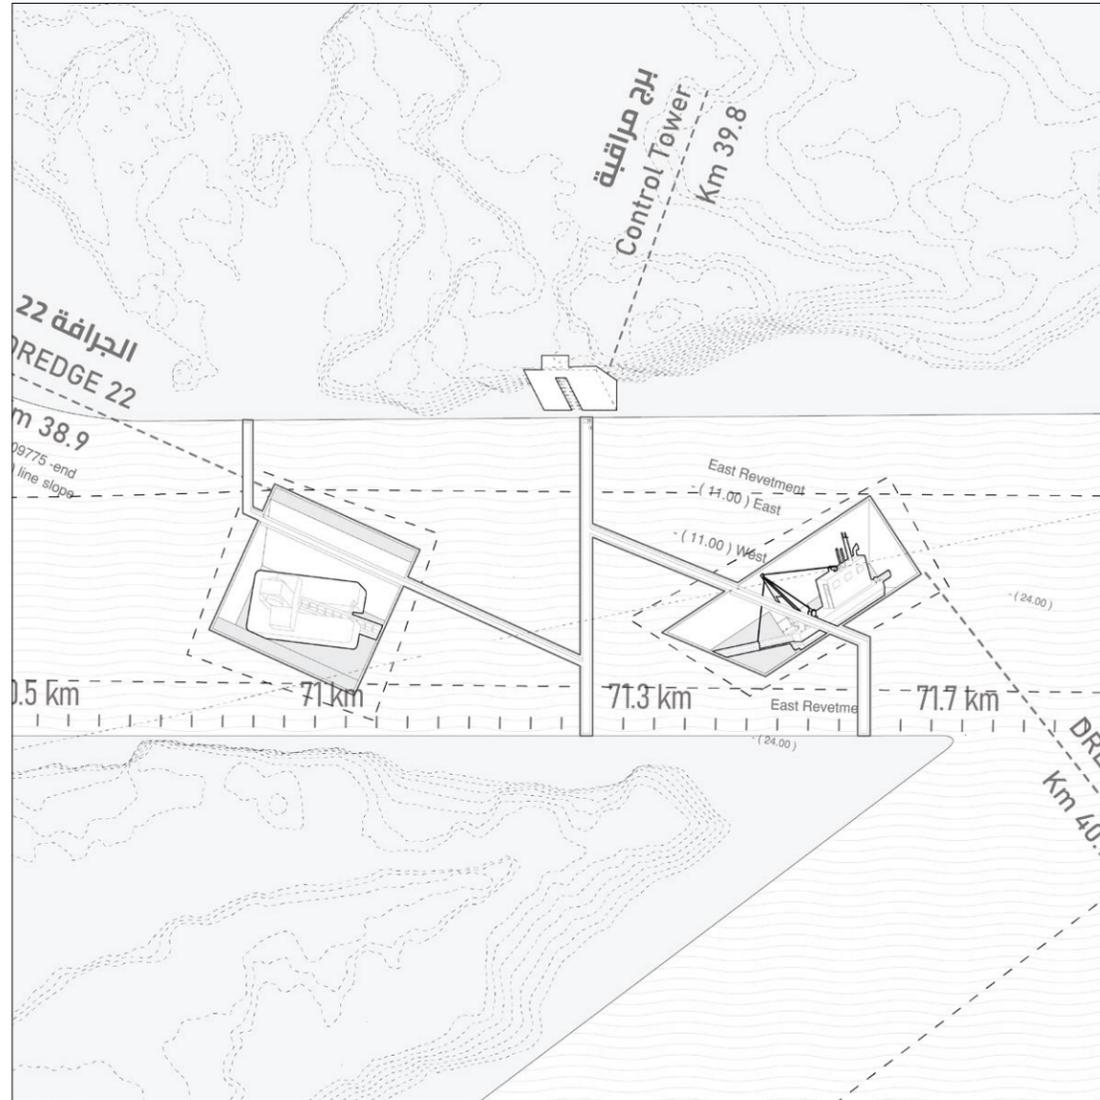

Slow Canal

Slow Canal

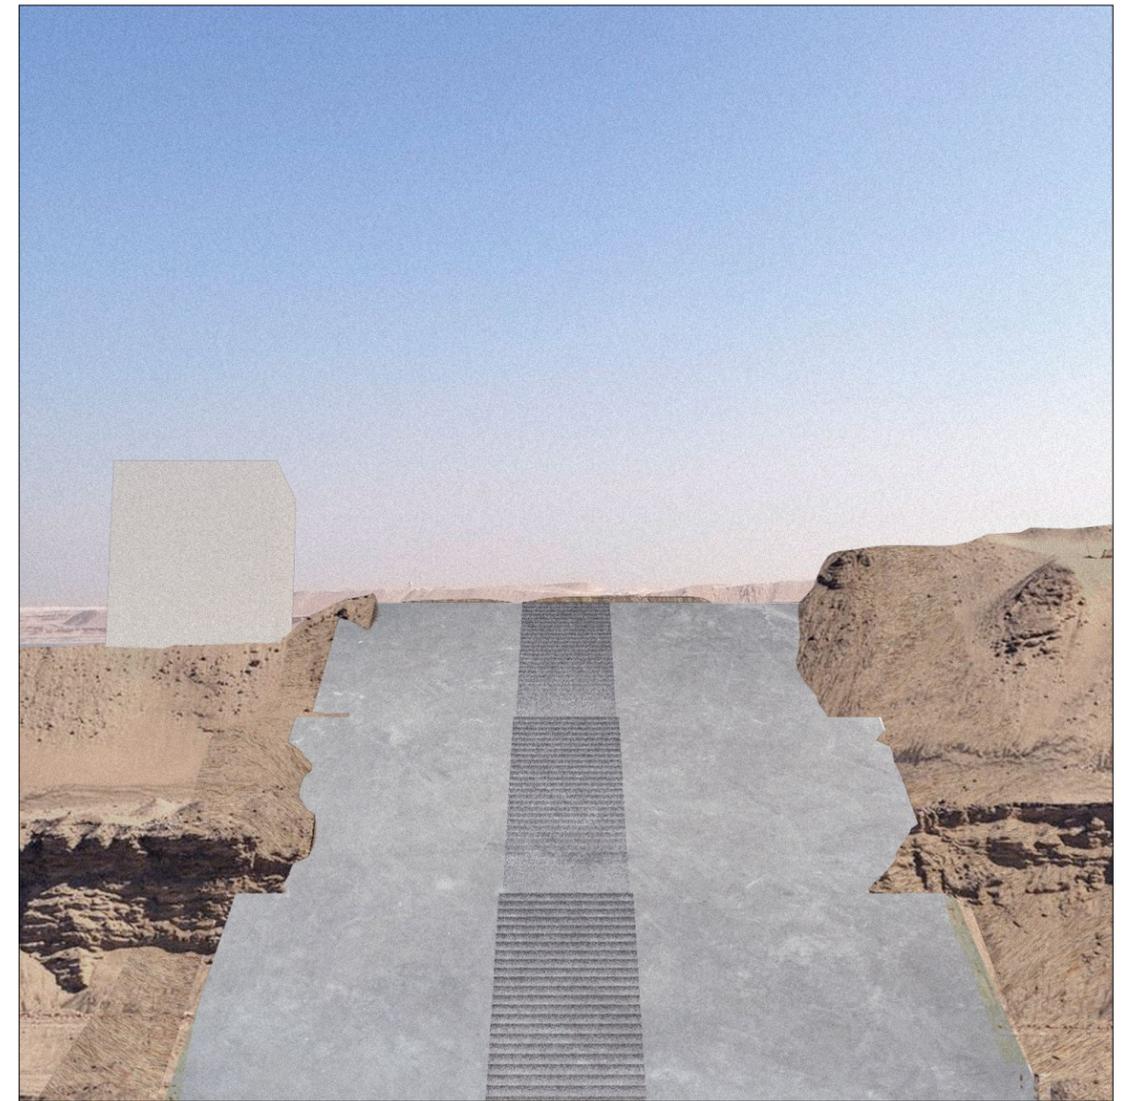

The act of procession through the canal can commemorate moments of nationalization, violence, and sabotage.

Slow Canal

The ostensibly simple act of moving petrochemicals and products from one body of water to the next ends up requiring a dense system of objects, spaces, and geopolitical negotiations

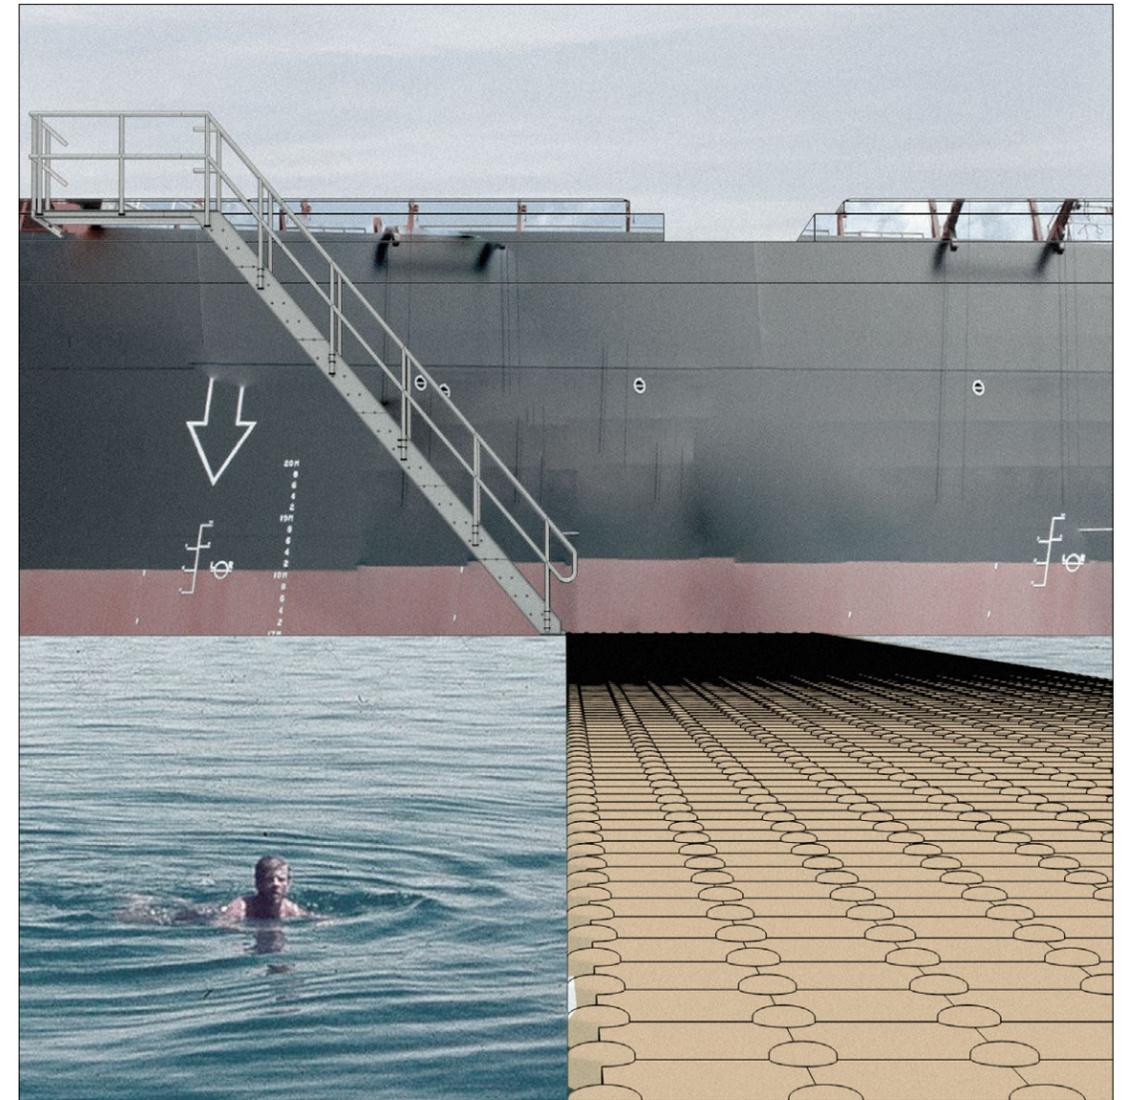

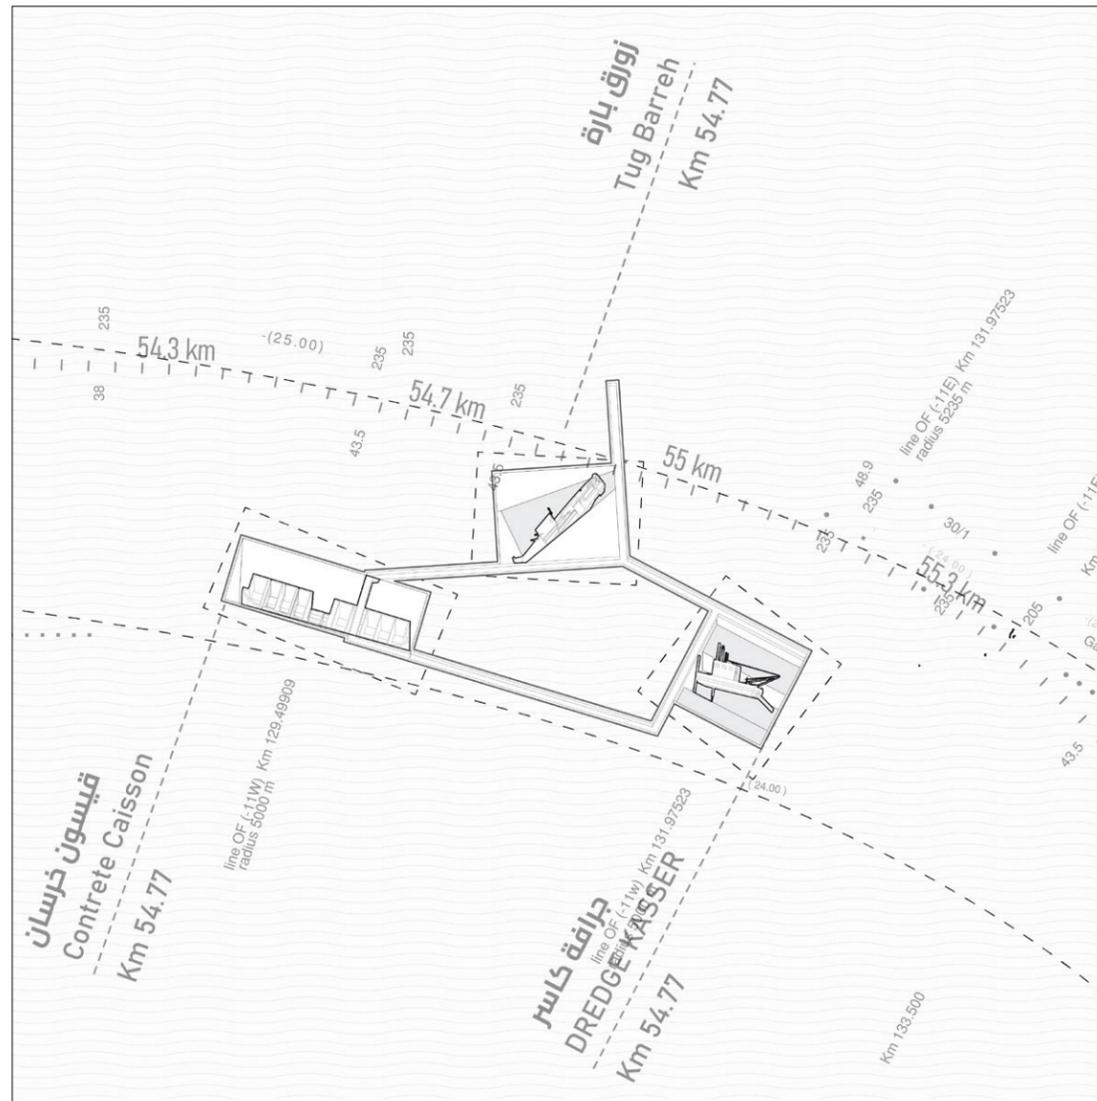

On the periphery, control and observation towers are placed in gaps between the accumulating displaced sediment.

Slow Canal

The ostensibly simple act of moving petrochemicals and products from one body of water to the next ends up requiring a dense system of objects, spaces, and geopolitical negotiations

Slow Canal

Slow Canal

The ladders on the side of anchored vessels are required to be permanently deployed to allow local economies to co-opt the moment of stasis.

Slow Canal

A condition is created where both the petrochemical activities and cultural moments occur simultaneously by co-opting the logic of the canal.

Slow Canal
