WALKING ON A DREAM is an experimental pavilion that utilizes the characteristics of the Mobius Strip to create a continuous, one way circulation that encourages users to constantly be on the move for social distancing purposes.

This three dimensional strip-turned-inflatable is pumped with opaque, colored air/smoke that exhibits a vibrant and dynamic display turning the pavilion into a sculptural piece with enhanced spatial qualities.

The inflatable object is highly interactive both physically, socially and visually.

Characteristics such as the density of changing colors are affected by the density of activities taking place as a result of areas of higher and lower pressures.
