

Towards a Bird City

Manhattan, New York
GSAPP Spring 2023

Instructor: Karla Rothstein

Team member: Eunyoung Lee

The entangled environment of birds and cities possesses opportunities for a new collective urban imagination that redresses the negative impacts of anthropocentric urban environments. We challenge the notion that cities are inevitably destructive to the life of birds. Through analytical mapping of found dead birds, 4WTC was chosen as an initial site of intervention. The mapping of different birds' nests reveals a correlation to their food resources under a height of 75'. The project proposes to reintroduce the 75' vertical biome into 4WTC by strategic removal and a lattice system that support biodiversity crucial to the sheltering, foraging, and nesting of non-predatory birds. Through the prototypical intervention of 4WTC, design tactics could be translated to other towers. Most importantly, the design logic derived from a bird's perspective is a forerunner to reconsider a series of human building inventions, ranging from a new skyscraper to regulation of building facades, yielding productive consequences to humans and birds alike, at the urban scale, body scale, and temporal / experiential scale. 3

Post Office for the Gig Workers

Manhattan, New York
GSAPP Fall 2022
Instructor: Laurie Hawkinson

This project speculates the future of USPS in Manhattan, New York. The significance of a post office is more than a service, it protects and ensures the movement of substances that people rely on. From hand written letters to commercial packages, the scope is expanding as the role of USPS strives to be emblematic of its time. Third party food delivery service has become an integral yet problematic part of big cities such as New York. Its hidden environmental costs and socially marginalized gig workers present a urgency for intervention.

This project proposes that USPS will replace current private companies to provide food delivery services with a reusable food container program. The current gig workers will become a new fleet of E-bike driver for USPS and deliver food as well as small packages. The existing Murray Hill USPS Annex is chosen to demonstrate the potential of USPS to become a social hub for delivery drivers, office staff, and the local community.

The Tale of Dougong

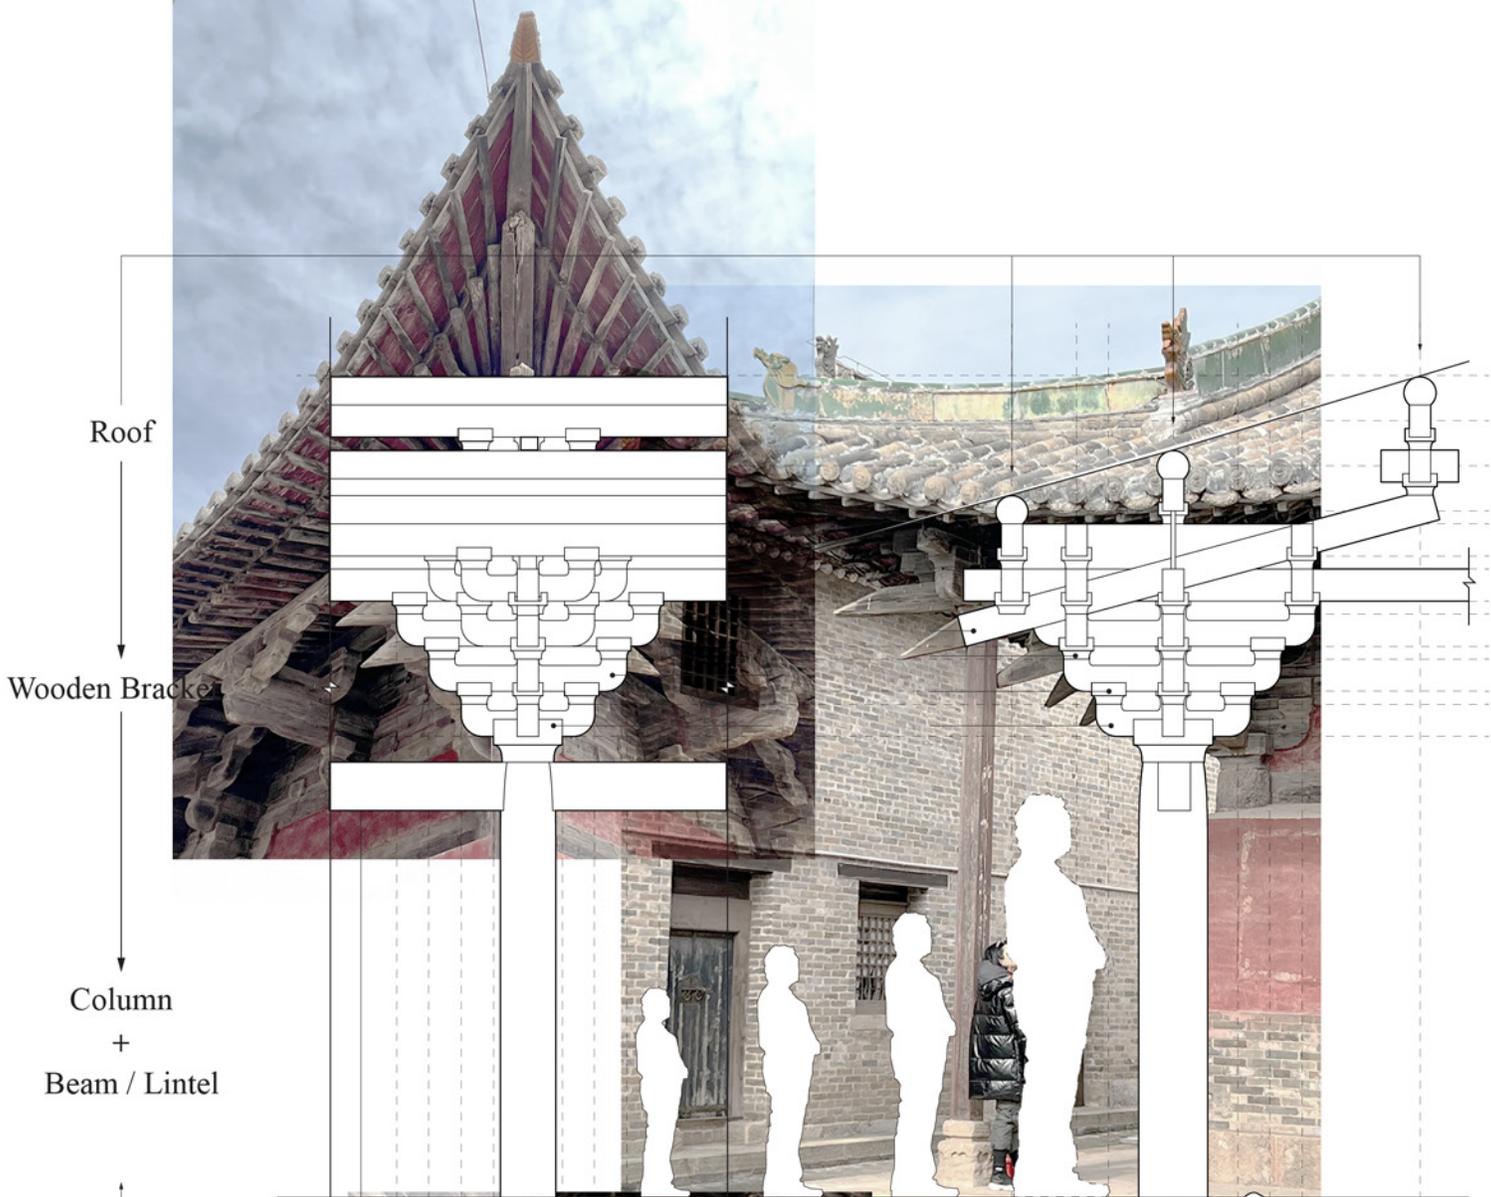

Siteless structural prototype
GSAPP Summer 2022

Instructor: Elias Anastas & Yousef Anastas

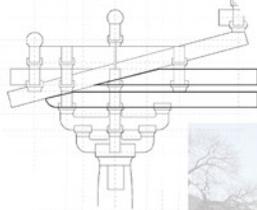

Dou-gong is one of the oldest and most recognizable architectural elements in wooden structures from east Asia. Instead of fetishizing Dou-gong as a cultural relic, this project investigates its potential in generating a unique architectural typology based on its flexibilities as a component and structural principles as a system.

My translation of Dougong utilizes a reverse inclined-arm-leverage system to balance the interior weight with the heavy arms on the exterior, opening up new possibilities for formal expressions. The interior weight transfers to the primary brackets through secondary brackets, making the periphery the primary system for gravity as well as lateral forces. The reasons for choosing a skyscraper as an applicable typology are two folded: exploring Dou-gong's primary function as a lateral system; problematizing capitalist efficiency embedded in the ideology conception of conventional skyscrapers.

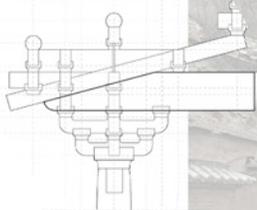

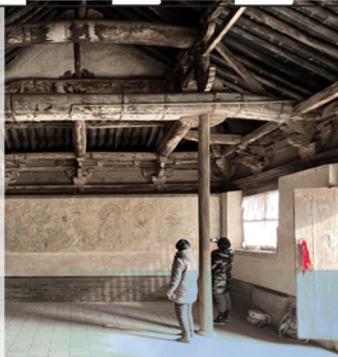

Case Studies:

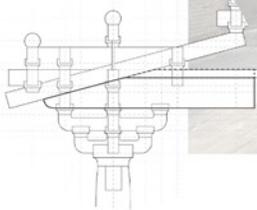

Scenario 1
Small timbers are sized to fit into the vertical Cai-fen system. This scenario is typical in palace typology of Chinese architecture according to YZFS.

Examples:
佛光寺 Fo Guang Temple
独乐寺 Du Le Temple

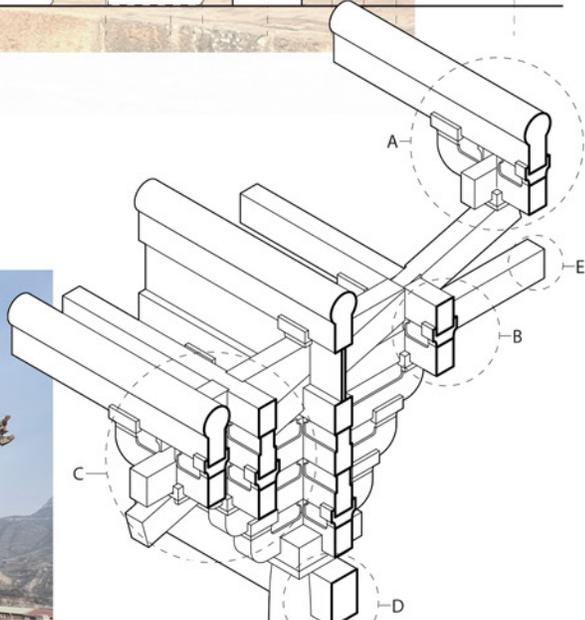

Scenario 2
Large timbers are sized to fit into the vertical Cai-fen system, aka the depth of beams is equal to multiples of Cai unit.

Examples:

Scenario 3
Timbers cannot fit into the vertical Cai-fen system, thus breaking the vertical grid. Additional piece is added to maintain the grid. (because other components are standardized.)

Examples:
奉国寺 Feng Guo Temple
镇国寺 Zhen Guo Temple

A. Leverage and Cantilever

The use of inclined arms allow the weight of the roof to cancel off the projecting eaves on the outside.

B. Material Properties

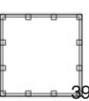

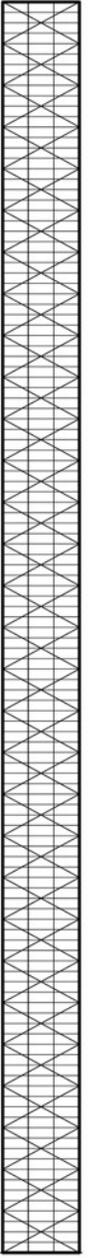

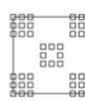

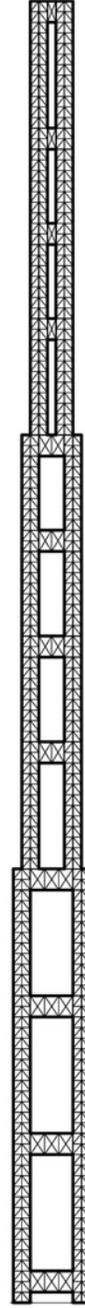

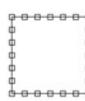

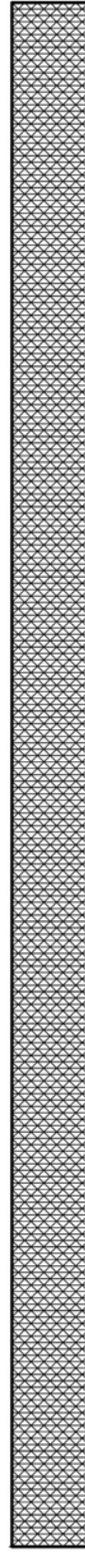

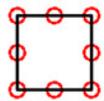

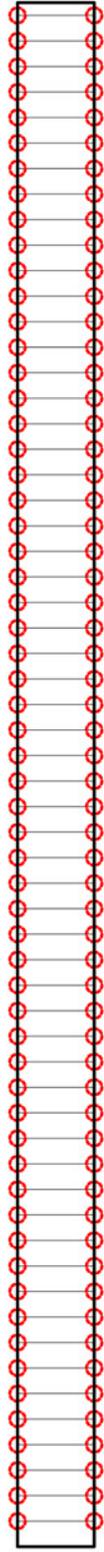

Use of blocks minimizes the impacts of material deformation on the structure as a whole.

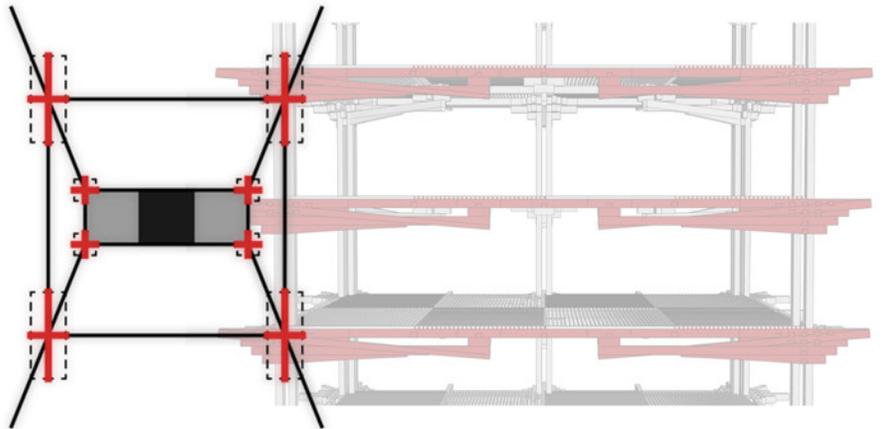

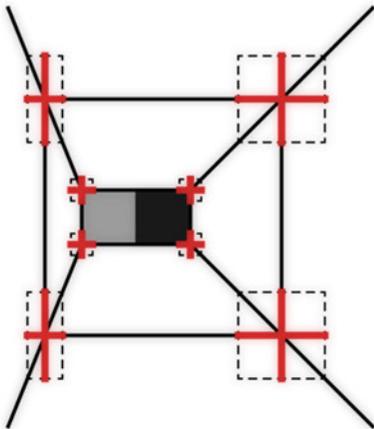

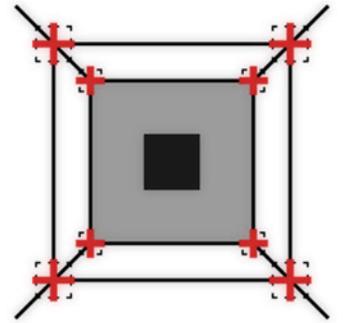

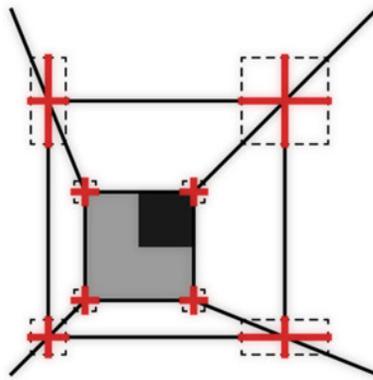

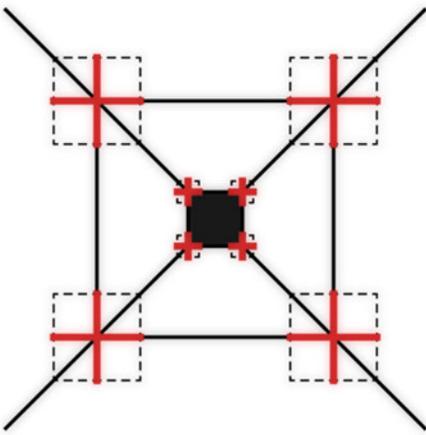

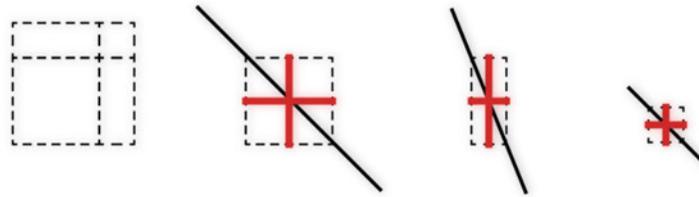

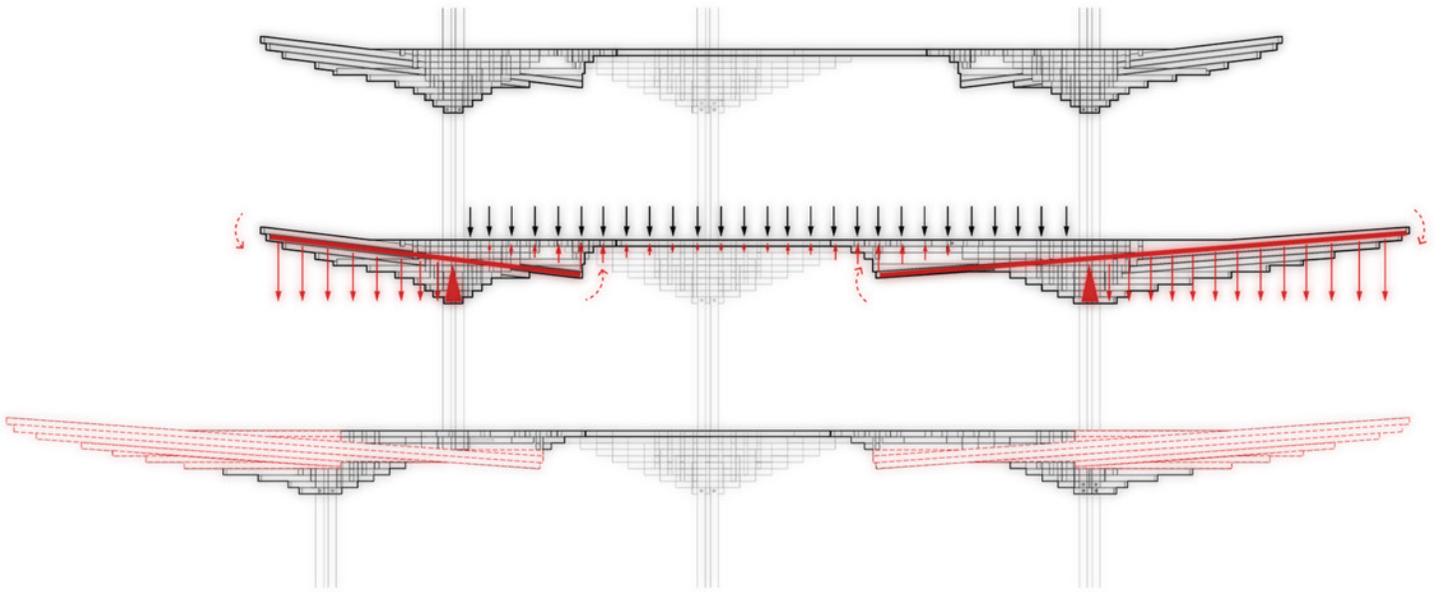

C. Lateral Resistance

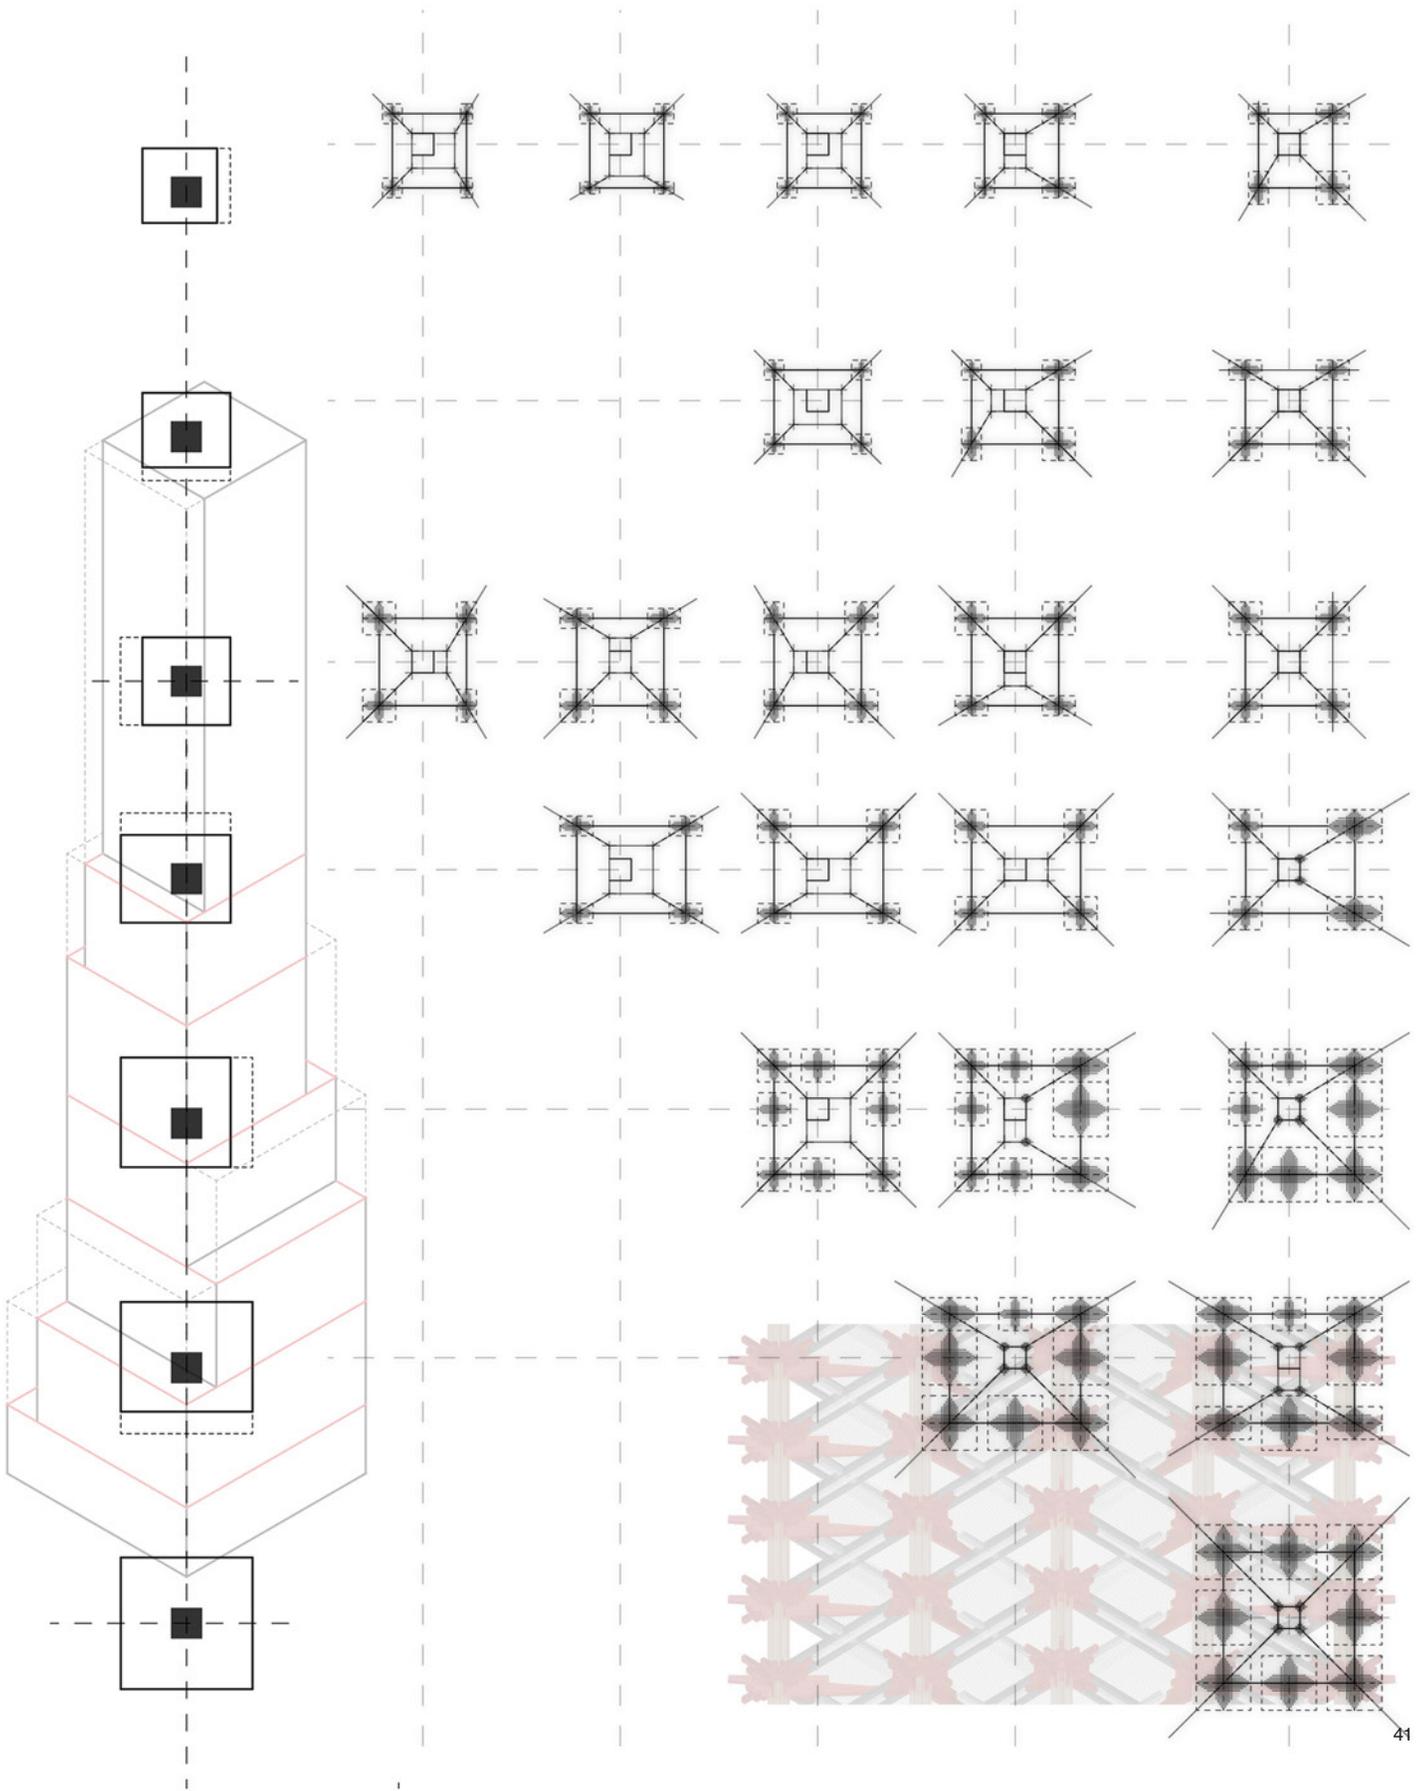

Additional layers of longitudinal brackets create resistance to lateral forces perpendicular to the projecting brackets.

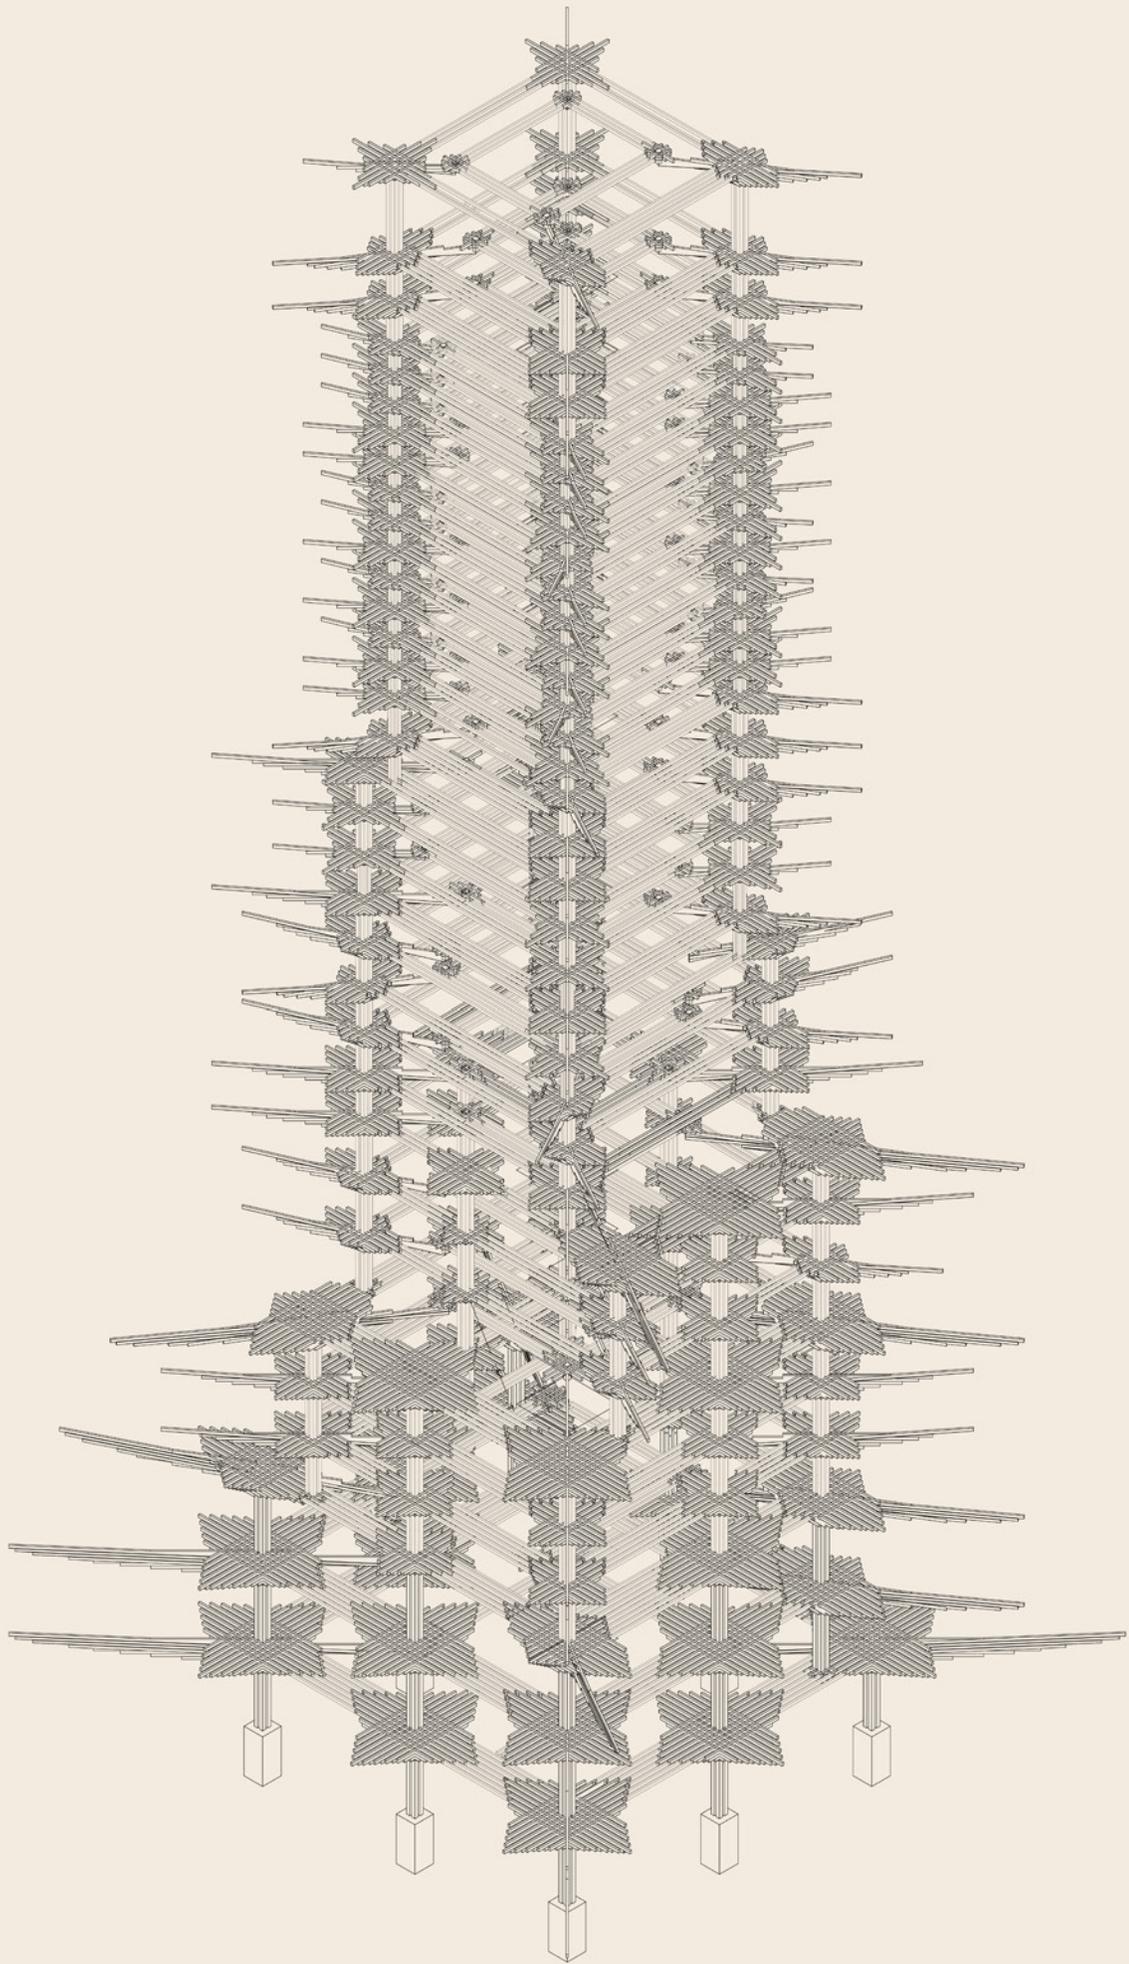

D. Impacts of later techniques

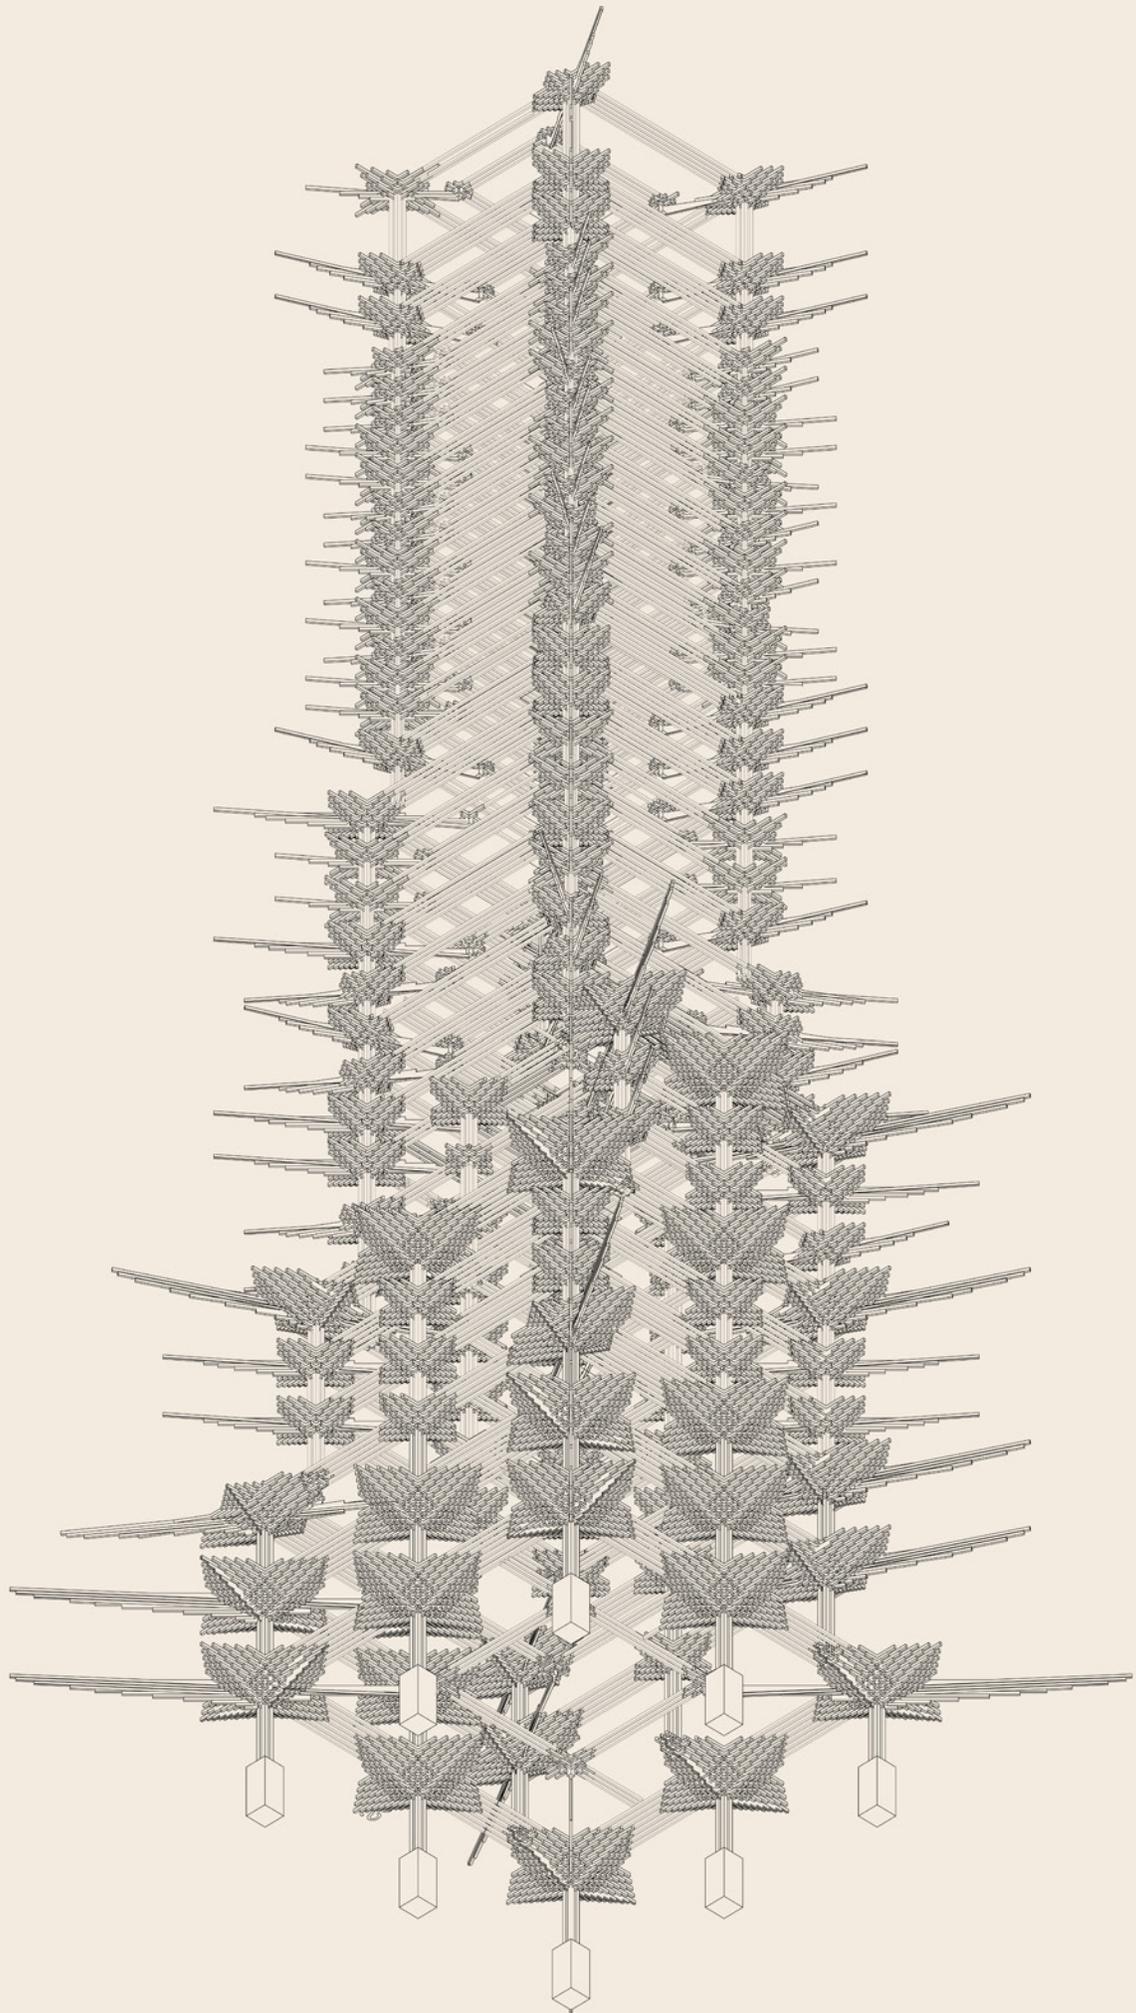

Later techniques were developed to join smaller timbers into bigger timbers, which led to wider use of big columns and beams, thus wooden brackets slowly become more decorative than structural.

EXIT

Lines

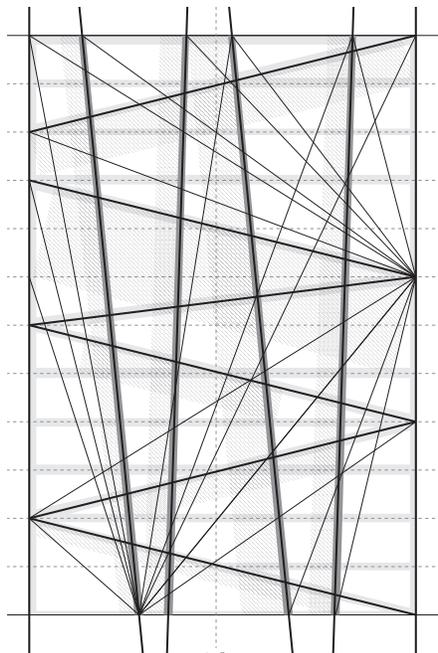

This technical project describes an airtight and watertight enclosure of a 13-story building occupied by an art gallery in the city of San Francisco.

San Francisco, CA
GSAPP Fall 2022
Advanced Curtain Wall Elective
Instructor: Daniel Vos

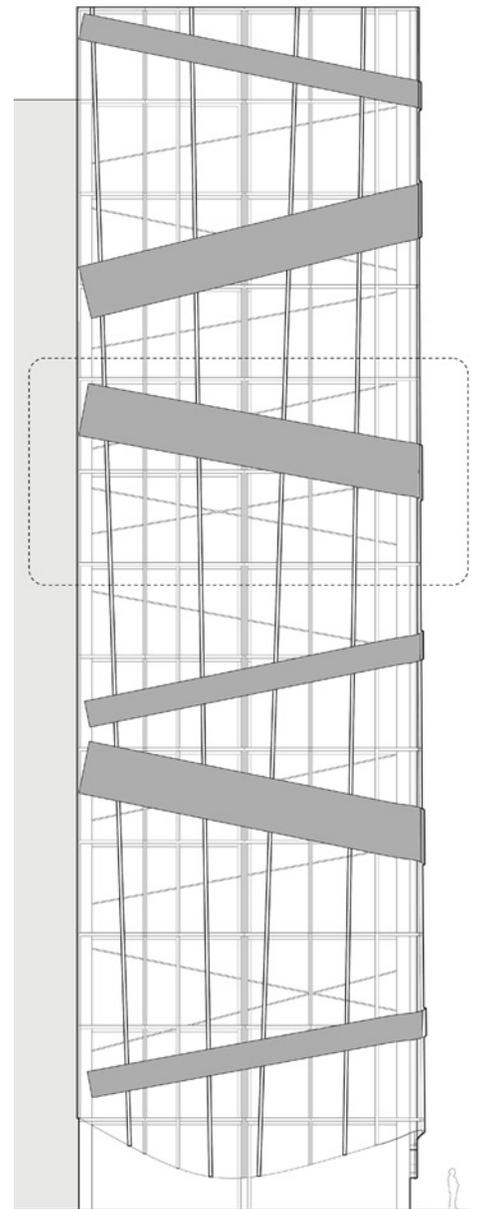

The design of the system takes inspiration from the painting *Lines from Points to Points* by Sol Lewitt and translates the ideas of “wrapping” and “lineweight” into a composite curtain wall system that deploys cables as a secondary system for lateral load on ICUs that are only dead loaded to floor slabs at two points, which helps the system to span a double height space without adding a beam. On the outside, the design accentuates certain “lines” via different exterior conditions on mullions: aluminum mullion caps accentuate certain vertical lines while drop-hook perforated aluminum panels are translated front the diagonal hatches in the original drawing.
