The Little Prince Primary School

adaptive Reuse for childhood development

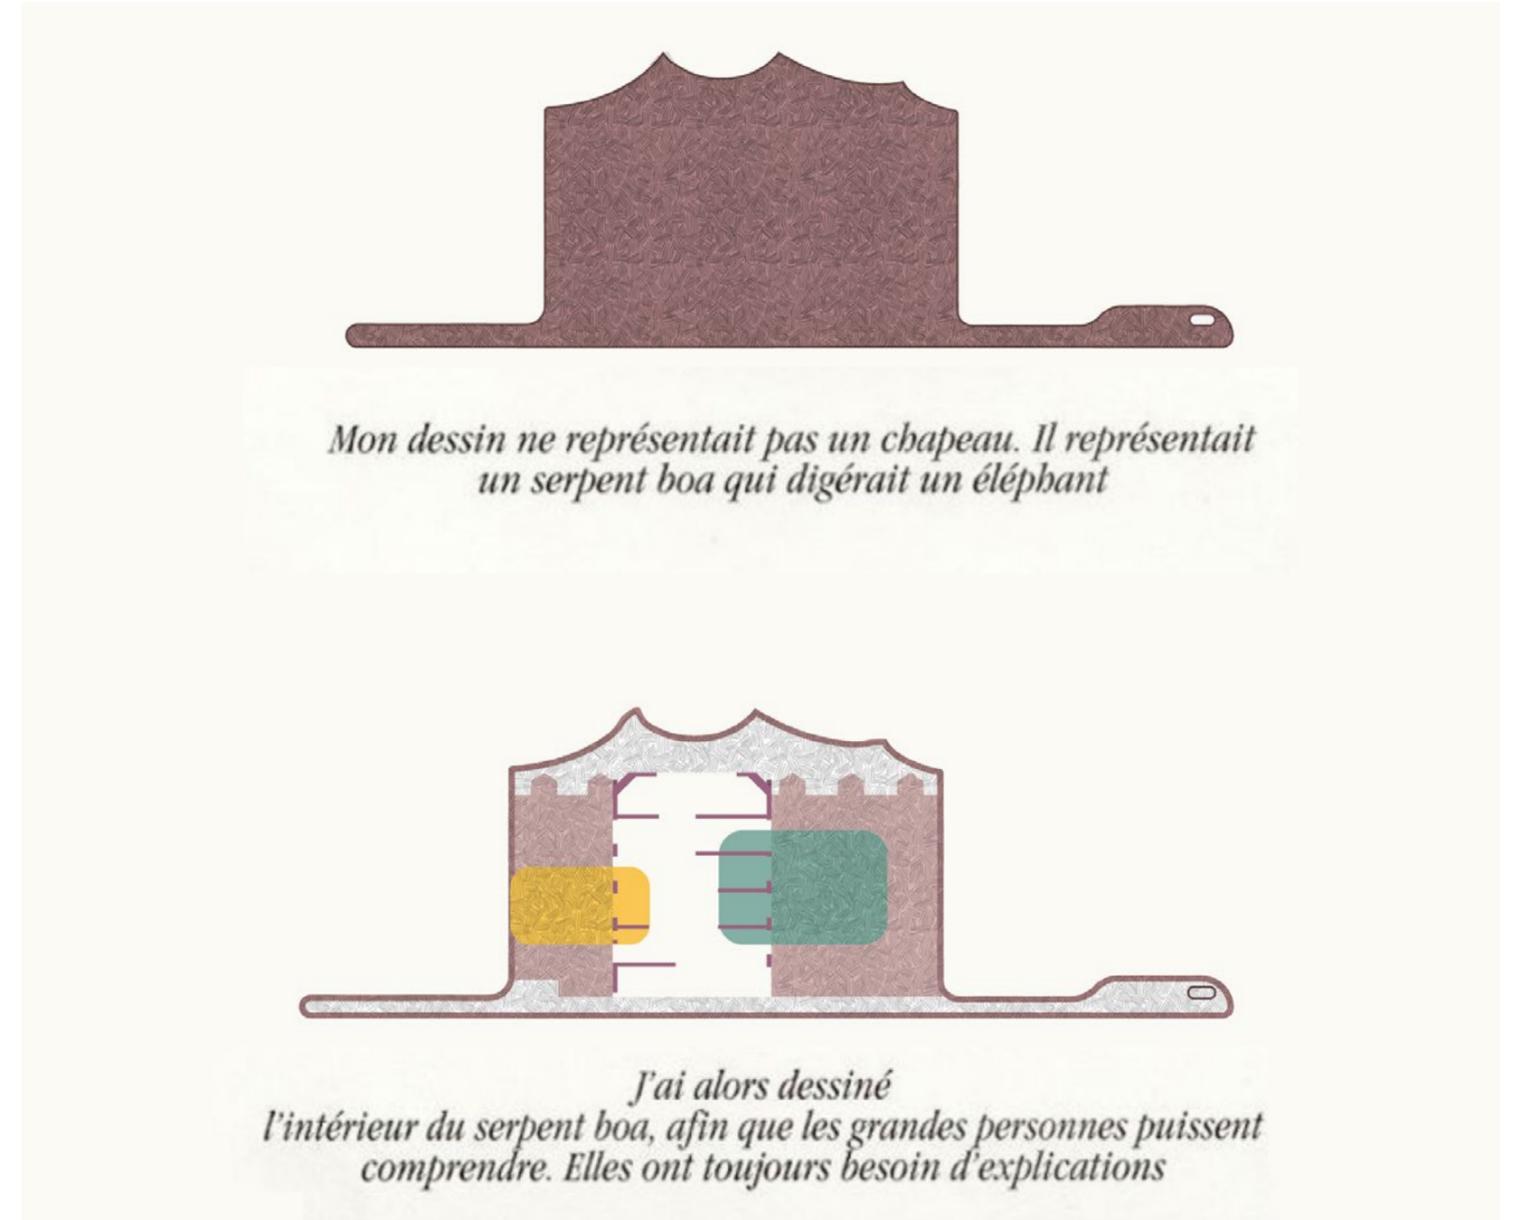

In the Little Prince by Antoine de Saint-Exupéry, the author is both a nostalgic narrator and an incessantly inquisitive child at the same time. The story follows a Little Prince from another planet learning about earth and meeting the narrator: a pilot. In the book, the stories of the pilot and the prince are misaligned in time, giving the impression of a single character that is apprehending the world with a child's eye while having the self-contemplation of an adult. St Exupery exposes themes about empirical knowledge vs. embodied knowledge, child mind vs adult mind, naivety vs. wisdom.

The Little Prince Primary School draws from the experience of cyclical reflexivity that occurs during childhood development. Using the existing C.B.J Snyder H-Plan building as a device to strengthen that experience. Expressing the overlapping narratives in the Little Prince, the school mobilizes this sequence of embodied learning by interlinking new and existing via thresholds at different scales. The shell of the existing building is permeated by a new insertion. The wall threshold can be crossed, penetrated enabling a backwards, forwards view of one's progress. Programmatic boxes permeate the existing shell while nesting within a circulation field; the whole is wrapped by a tensile structure protecting and defining grounds for play. Catwalks tie these thresholds together, creating inner sanctum spaces that juxtapose program, tectonics, and experiences.

Supercore

subvert real-estate tactics with a super-core that reinvents the relationship between shared and private housing programs

Born from an ethnographic study of Melrose's edges, the Supercore subverts traditional real-estate tactics by re-imagining the relationship between shared and private programs. The Supercore folds the city into a co-living courtyard, while multiplying edges and thresholds, acting as an armature for the economic and social resiliency of its residents.

BRONX DOCUMENTARY CENTER

Afterlife

of corporate office parks

We call for an expansive process of vaccination, remediation, construction, cultivation, and rewilding--an alternative to current modes of production, including those in the nascent cannabis industry, which has largely followed existing paradigms in big pharma.

The project accomplishes this in two principal ways: first, by remediating the ruins of the former IBM campus in Kingston; second, by allowing minority populations affected by the “war on drugs” active participation in the ethical production of cannabis.

The remediation processes that accompany this provides the building blocks for the resulting landscape and earthenwork architecture. In the short run, the future cannabis commune serves as a vaccination center, building trust with marginalized communities. In the long run, the proposed model becomes a generator of justice and an ecologically productive part of the environment, inherently limited in space by the confines of past industry and temporally by natural cycles of healing and growth.

Disobedient Objects

resisting gentrification in west harlem by grafting a recycling leisure center to the 125th street viaduct

*125th Street Viaduct
Harlem, Manhattan*

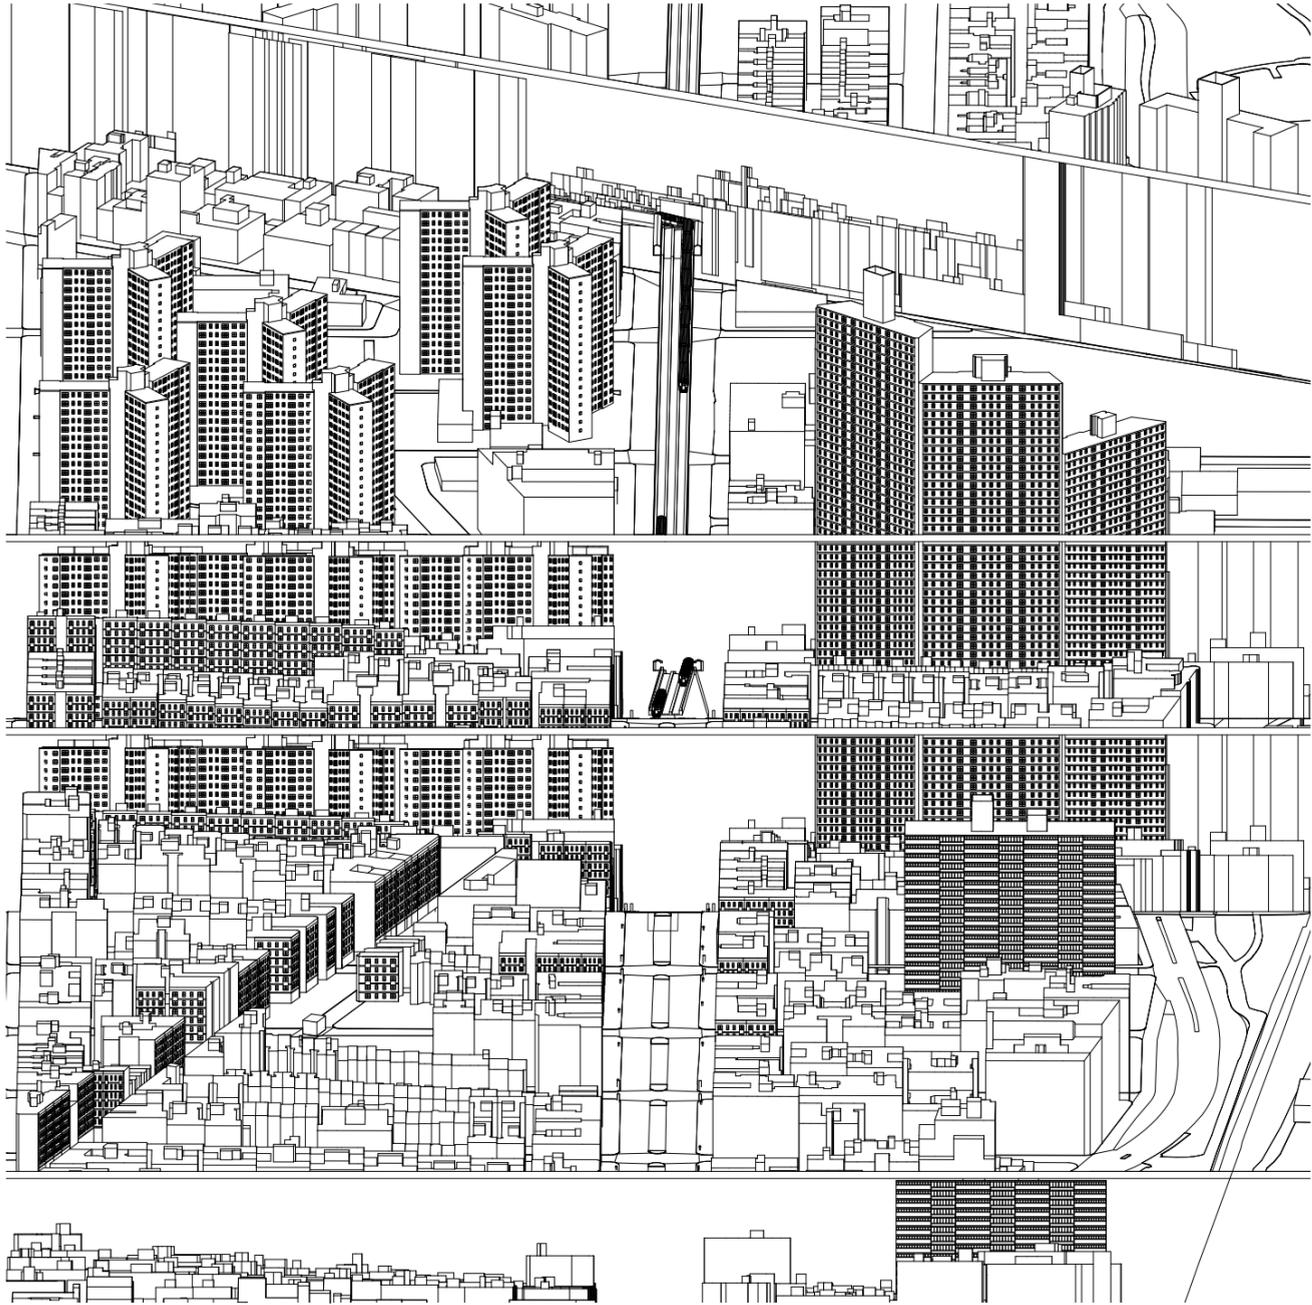

Taking inspiration from the strong culture of public life in Manhattanville, this scheme is a leisure and recycling center under the 125th subway viaduct. The project is interested in subverting the western idea of loitering and examining what happens when objects - littered on the street are repurposed for leisure - becoming disobedient. Historically, social movements show a compelling relationship between repurposed objects, protests and leisure. The intervention is parasitic to the viaduct structure turning spaces into disobedient objects themselves. Programmatic objects are linked by catwalks turning leisure and recycling into a theatrical event. That voyeurism of seeing people engage in activities in a public setting is heightened by the tectonics of a transparent fabric draped over and around the objects. Overall, the project treats loitering, public life and leisure on the street as heritage of the area to be preserved and instrumentalized to strengthen community identity and defy gentrification.

Urban Fabric

de-densifying the Garment district introducing housing for circular economy

The Urban Fabric District uses the Garment District as a prototype to return life to homogenized Manhattan neighborhoods. The project operates on two levels: an architectural operation to increase light and air to levels necessary for housing, and a programmatic reorganization of the block to integrate previously separated user groups through a circular economy of material reuse.

Midtown has historically shifted from a mixed-use district. While today Midtown Manhattan is dominated by office space, it was once a thriving mixed-use neighborhood. The garment industry cuts across many types of labor and social groups, ranging from garment manufacturers, designers, hobbyists, and wholesalers. The NYC garment industry has struggled with increased rents.

The project unites two typical Midtown blocks into a superblock for the garment industry. Types of labor and work are blurred together, as workshops, tools, social spaces, and circulation are shared.

A Dip in Heritage

adapting the *bibliothèque nationale* by Henri Labrouste into a swimming pool

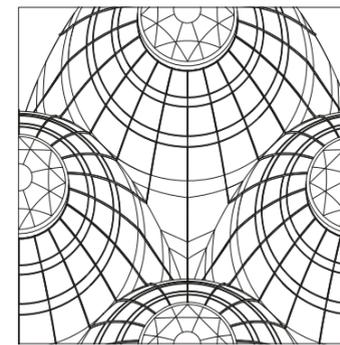

This drawing and representation project speculates on the possibilities of adapting the *bibliothèque nationale* by Henri Labrouste. In France, there are a plethora of lesser known 19th century iconic structure that are often neglected and fall into disrepair. Drawings and models were used to analyse and understand the structural and construction principles in the domes while depicting the contrast of an optimistic hedonism that could further propagate the reuse and adaptation of other neglected historic structures into objects for public leisure once again.

IBM Forest Data Center

Exhibition featuring mushroom powered computer

In a post-petro future, we imagine a biobased data center made up of a forest. Forest trunk rings will store our data and be wired through mycorrhizal networks underground. Each person will be given their own tree and as the tree grows, so can their data storage. This forest and mycelium growing center will be superimposed on the existing degrading IBM data center.

Participants will imagine where their data is stored in a post-petroleum bio-computing world. As one enters the space, there is a transition from the electronic waste of current petrol fuelled data centers to the future of grown computing. The diversity of species allows for multiple networks of data storage and different methods of communication.

Model Fictions - Scenographic modelling for film

Significant advancements in organ transplantation (and organ engineering), coupled with the accelerating effects of a fragmented gig-economy has resulted in a population of humans that need very little sleep but instead must move constantly, like sharks, to stay fit and alive. They sleep in sub 1-hour bursts wherever they can and move on.
