_TITLE Begins the story...

+ + +

_ P R O L O G U E

I like stories, those which tell how people meet each other and form their relationships, and I believe that the physical environment plays the essential role as the stage for those romantic plots. Coincidence or pre-ordination is driven by the interconnection of several daily routines, and the points of those intersections are urban public spaces which accommodates people's everyday life.

Designing space is designing people's lives. I have always been thinking that architects are acting like entrepreneurs, trying to call citizens' collective memory.

find the balance of interests from different groups and seek an optimal solution: we organize urban space, provide possibilities for people to build connections with other objects, and the process of design resembles a social practice, which puts every aspect of the society into consideration.

At the present technological society, people are drifting apart from each other, living with cell phones in the virtual world. My works in this portfolio are mostly based on human experience in attempt to re_TABLE OF CONTENTS

SEEDING THE MACHAMBA

Urban Design Studio III Spring 2020 Site: Beira, Mozambique Instructor: Kate Orff, Geeta Mehta,Thaddeus Pawlowski, Lee Altman, Dilip Da Cunha, Julia Watson, Adriana Chavez Team: Joy You-Chiao Wu, Jaime Palacios Anaya, Ashwin Nambiar, Xinyue Liu Role in Team: Research, Conceptual Design, Modeling, Renders

The city of Beira has an extensive and integrated system of traditional agriculture that is under threat. Our project conceives of this system as more than just agriculture it is a productive and preventative flood infrastructure. We envision that this agricultural system could coordinate communities, organize the city, and be the key to recovery and ongoing resilience. Our goals including Consolidate and organize cooperatives at a city scale, Protect social and ecological capital, Empower women in agriculture, Diversify income and create job opportunities, Integrate adaptive, nature-based infrastructure.

01

Of the 71 sites assessed, 82% are located in Sofala and Manica provinces which represent 85% of the displaced population.

Currently, the resettlement plan defines "risk zones" and resettles the people to further inland, it disregards people's livelihoods and that's why people keep moving back to the settlements and stay in the front of the threats of flooding.

Urban Morphology

STUDIO | SPRING 2020

"Flooding" is a consequence of unplanned sprawl into low-lying agricultural land. The current resettlement plan disregards people's livelihoods and defines "risk zones" in the city, instead of recognizing them as assets for the city. Need of elevational programming for future cyclones and urban growth.

Beira 2020

Beira 1990s

Since before the colonial times, small scale agriculture has been embedded in the livelihoods of the people from Beira. This map depicts the correlation of the damaged areas of the city with the 10 historical agricultural neighborhoods defined by the Green Zones Office. In 1987, about 88% of the agricultural land in the city was considered a machamba. People started organizing in women led cooperatives and, in 1990, the General Union of Coops became an independent Coop Company. Lack of support from the government disincentivized members to work together, but their agricultural practices remained in their machambas.

Based on this water-holding system we propose three community based organizing frameworks to facilitate urban transformation according to different social contexts.

The overall objective is to strategically retreat to safer zones combined with community empowerment and economic development.

High Ground Coop - Provide welfare facilities / densify housing Low Ground Coop - Increase agricultural production and manage water holding systems.

Mid Ground Coop - Boost economy by scaling agriculture / aquaculture production.

NEIGHBORHOOD MACHAMBA

ADD-TRAINING HUB / MARKET

ER.

NEIGHBORHOOD MACHAMBA

STUDIO | SPRING 2020

Here the machamba system will seed the mid-ground in the form of a co-operative industry that can sustain the large scale agriculture surrounding it. With a strong expertise in machamba management, women can easily secure skilled jobs in these industries. Also the farmer training schools in the low ground can help farmers transition to a floating machamba system by piloting it in the existing reservoir.

Co-op can also help communities for land transformation and building floating machambas. Floating machambas production system can Guarantee food production in different climate condition as well as food diversity. The system does not rely on available fertile land; and it uses less space than conventional crop production, generating high yields of both vegetables and fish for consumption.

Urban Design Studio II Fall 2019 Site: Hudson Valley, New York Instructor: Kaja Kühl, Anna Dietzsch, Jerome Haferd, Liz McEnaney, Justin Moore, Shachi Pandey, Raafi Rivero, David Smiley, Dragana Zoric Team: Mansoo Han, Niharika Shekhawat, Shailee Shah Role in Team: Preliminary Research, Conceptual Design, Modeling, Axonometric Drawing, Renders, Video Making, Community Interaction, Interview

USA produces an estimated 6,456.7 million tons of CO2 every year. Healthcare industry accounts for 10% of the total greenhouse gases generated and has experienced a 30% increase in the rate of gas emissions from 2006.

In the Hudson Valley, geography of the region drives people's health seeking behavior, residents travel upto 1.5 hours one way for their basic health needs. At the same time, many hospitals in the Hudson Valley have 50% percent vacant bed space, that can be more efficiently repurposed.

The project challenges and changes the perspective of the current healthcare system from being a measure of cure to an extension of health and wellbeing of the community. Therefore, we reimagine dispersion of wellness through an additive typology that empowers the role of social infrastructure to spread a wellness network in rural areas, that substantially lower the environmental impacts of the healthcare sector, and create an equitable and sustainable model.

Urban Design Studio I Summer 2019 Site: Sunset Park, New York Instructor: Tricia Martin, Nans Voron, Hayley Eber, Sagi Golan, Quilian Riano, Austin Sakong, Shin-pei Tsay Research Team: Mansoo Han, Niharika Shekhawat, Design Team: Claudia Kleffmann, Vasanth Mayilvahanan Role in Team: Preliminary Research, Conceptual Design, Modeling, Axonometric Drawing, Renders, Video Making

Sunset Park's Waterfront is an Industrial area which has multiple underutilized NYC properties that has a great connectivity, and it currently hosts SIMS, the facility which receives 100% of NYC's residential recyclable waste and sorts it for later recycling. But, all this residential waste only represents 25% of NYC's Waste Stream. The remaining 75% is Commercial Waste of which only 22% gets recycled. And this recycling happens scattered all over the city, costing a lot of money and polluting due to its distribution. This project proposes a Green Waste System that will manage and recycle NYC waste, by locating a number of processes in one specific area, therefore reducing transportation, money and time invested in recycling, creating an asset at Sunset Park that will give back to the community by providing jobs, education, public spaces and energy.

End of the story...

+ + +

_EPILOGUE

Honestly, I was once a pessimist towards the present technological society where people are drifting apart from each other. However, my encounter with architecture helps me recognize the power of space and ignites my passion to explore a better living environment and a promoted city life, which leads to my decision to further my study, namely that provide a better setting for people to create their unique stories.
